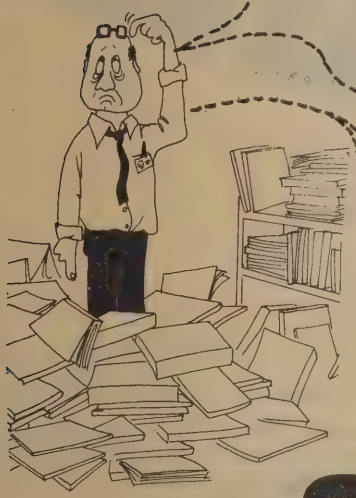
What can I use to keep all the manufacturers' product data I receive in order?

What system makes filing or retrieving manufacturers' catalogs fast and easy?



Which file system have thousands of engineers purchased because they know it works?

eem FILE SYSTEM

THE ONLY FILE SYSTEM DESIGNED SPECIALLY FOR THE ELECTRONIC ENGINEER!

The publishers of **eem** have put together a unique filing system for electronic product information. The complete system includes: a product index booklet which classifies electronic products into 3,000 listings both alphabetically and by product group, and 45 file folders imprinted with the **eem** product sections (extra gummed labels included for expanding the system.)

As you receive manufacturers' catalog data sheets, technical bulletins, or clip magazine articles, jot down the proper Product Section Numbers from the **eem** PRODUCT-TO-SECTION INDEX. Then simply file in order. When you require information on a specific product, refer to PRODUCT-TO-SECTION INDEX again to locate the correct file folder. It's simple, and you'll always have the necessary data to compare, specify and buy, right at your fingertips.

Here's how to order your eem FILE SYSTEM:

For the complete system send $10 (plus tax; N.Y., 8%, CA, 6½%) in check or money order to:
United Technical Publications, Inc.,
645 Stewart Avenue, Garden City, N.Y. 11530
Att: Circulation dept.

For an **eem FILE SYSTEM** without file folders send $7.50 (plus tax; N.Y. 8%; CA, 6½%).

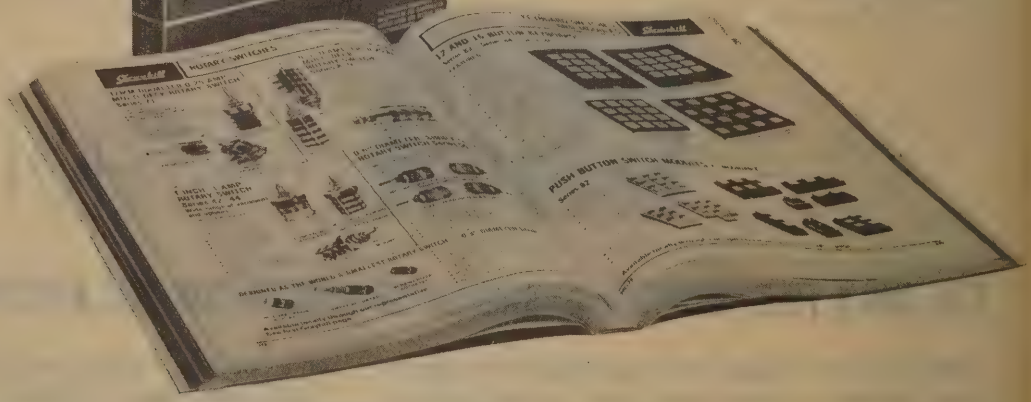
CATALOGUE DE L'ELECTRONIQUE POUR LES INGENIEURS
DER PRODUKTKATALOG FÜR ELEKTRONIKER
ELECTRONIC ENGINEERS CATALOGUE

The 1978 edition is out...and the response is in...
IMMEDIATE AND OVERWHELMING

ACCEPTANCE



The ELECTRONIC ENGINEERS CATALOGUE is the only comprehensive, trilingual catalogue/source-directory of electronic products available to—and from—Western Europe.

It is divided into three distinct sections: 1. **The Product Index and Directory,** which lists more than 3,000 product headings & cross-references alphabetically in English with their French and German equivalents. 2. **The Manufacturers' Catalogue Section,** which is a compilation of Manufacturers' Catalogues in alphabetical order. 3. **The Manufacturers' Sales Offices and Trade Marks Directory,** which alphabetically includes country, address, telex or TWX numbers of the Manufacturers' main and local sales offices and/or agents.

The ELECTRONIC ENGINEERS CATALOGUE offers U.S. manufacturers the most cost-efficient method of distributing their catalogue data to **25,000** electronic engineers and buyers throughout Western Europe. It represents the carefully conceived application of the time-proven **eem** "cataloging" concept to the elusive European marketplace.

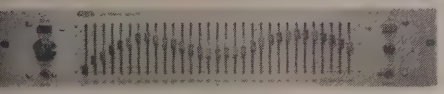
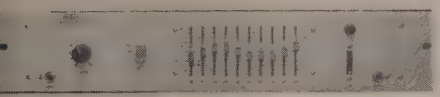
GRAPHIC EQUALIZERS



MODEL 231 —
THIRTY ONE ⅓ OCTAVE



MODEL 213 —
TEN OCTAVE

Both cover the entire audio spectrum and permit complete control of spectral balance. Both models are normally used with unity gain, input to output.

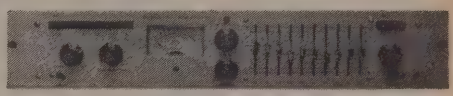
The Optro Model 213 offers 10 in-line, linear controls to control boost or cut-off for each octave. A filter in/out key enables a preset equalization to be switched in or out for specific program requirements. An input level control effects overall gain.

In the Model 231 thirty one in-line slide controls control boost or cut of each ⅓rd octave. A filter in/out key enables preset equalization to be switched in or out for particular programs. The Model 231 is probably the most flexible graphic equalizer — providing detailed emphasis or de-emphasis of even small sound spectrum segments.

The Dual Band Limiter-Compressor operates over two independent bands, one below and the other above 300 Hz. The independent release times in each band prevent high level low frequency signals modulating the audio level in the other band.

A long release time is provided in the low band to prevent signal distortion whilst it is possible to maintain a shorter release time in the high band.

This system ensures a more balanced sound whilst maintaining a constant high level of modulation.

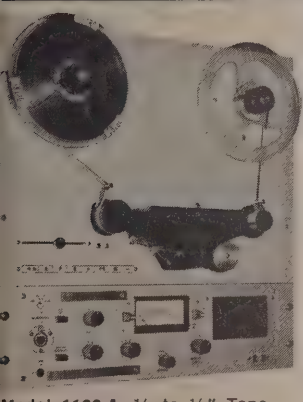


The Model 740 Audio Processor combines a microphone amplifier, a limiter compressor, an audio gate, a graphic equalizer and a line drive amplifier in one compact rack package.

Taking only 3½″ of rack space, the Audio Processor is one of the most versatile and useful units to become available to the professional audio engineer.

Overall frequency response is 30 - 15 kHz. ±0.5 dB. The unit contains its own regulated power supplies with overcurrent protection.

MULTI-CHANNEL MAGNETIC TAPE RECORDERS



Model 1100-A: ¼ to ½″ Tape
Model 1100-B: ½ to 1″ Tape

With configurations ranging from 1 to 32 track, the 1000 & 1100 Series handles ½, ¼, 1, 2, & 3 tape on spools of up to 14″ diameter. The basic layout consists of a console or rack mounted tape transport with power supplies and track amplifiers. The tape transport itself consists of a precision machined aluminum plate on which all components, including the solid state control box, are mounted. Servo control of the spooling motors provides constant tape tension from start to finish of the reel, smooth tape handling being assured by a direction sensed dynamic braking system. Disc brakes are provided as holding brakes when the transport is stationary. The servo capstan motor is crystal-locked, providing absolutely steady tape drive. Headblocks are plug in and quickly interchangeable, and incorporate all equalization components, enabling instant change of head format and equalization. Record bias frequency is crystal-locked. Although push button selectable 3 speeds (7½, 15 and 30 i.p.s.) are standard, an inbuilt vari-speed facility permits continuous variation from 7½ to 30 i.p.s.

These decks are a professional user's dream; they are robust, reliable and efficient. Designed for heavy duty, continuous use, they are typical of the New Era range being marketed by IEM.

- **Tape Speed:** 7.5, 15, or 30 i.p.s. Also vari-speed from 7.5 to 30 i.p.s.
- **Replay response** (at 15 i.p.s.): ±1 dB 30 Hz to 15 kHz.
- **Overall response** (at 15 i.p.s.): ±2 dB 30 Hz to 15 kHz.
- **Noise:** Better than 68 dB below peak record level.
- **Distortion:** Less than 2.5% T.H.D. at peak record level. (Peak record level is equivalent to 54 mM/mm track width.)
- **Distortion:** Less than 1% T.H.D. at normal record level.
- Crosstalk: Better than 50 dB between adjacent tracks.
- **Wow and flutter:** Less than 0.07% R.M.S. in the band 0.5 Hz to 250 Hz.
- **Input impedance:** 10K ohm balanced.
- **Input level range:** +2 dBm to +24 dBm for peak level on tape.
- **Output impedance:** Less than 100 ohms in the band 30 Hz to 15 kHz.

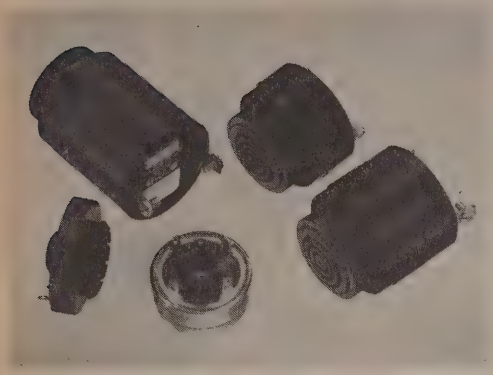
MALLORY Sonalert®
ELECTRONIC AUDIBLE SIGNALS



Mallory sonalert signals produce an audible tone by electronic means.

A soft soothing tone or a pleasant chime may be used as a gentle reminder. A more urgent "attention getting" message can be delivered by a louder pulsing or beeping Sonalert signal. For emergencies, or to cut through heavy background noise, a very loud sound blast is available.

Four tone frequencies, three loudness levels and seven modes, or rhythms, may be combined to produce over 30 distinctive and useful sounds.

Sonalert signals may be powered by any electrical source ranging from single cell batteries to industrial power lines. Very little electrical power is required making them ideally suitable for portable battery operated equipment. This low power feature allows the Sonalert signal to be turned on or off with a low power transistor, SCR, or integrated circuit. Completely solid state with no moving parts, no arcing, and no mechanical wear, the Mallory Sonalert signals will give you many years of trouble-free efficient service.

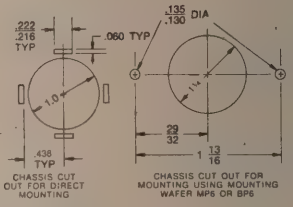
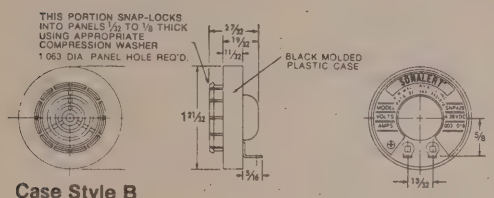
Case Style A

Terminals—.032 steel, tin plated with .093 dia. wire hole, will accept standard 3/16" quick disconnect.

BP6 BAKELITE MOUNTING WAFER



Mounting—Four lanced twist mount ears per EIA std. RS395 are provided for mounting. Terminals are electrically isolated from case and mounting ears. Also may be mounted using mounting wafer number MP6 for uninsulated mounting or mounting wafer number BP6 to insulate case from chassis.



THIS PORTION SNAP-LOCKS INTO PANELS 1/32 TO 1/8 THICK USING APPROPRIATE COMPRESSION WASHER
1.063 DIA. PANEL HOLE REQ'D.
BLACK MOLDED PLASTIC CASE

Case Style B

Terminals—.016 brass, hot tin finish with .076 wire hole. Terminal will accept standard 1/8" quick disconnect.

Mounting—Panel hole 1.063 ± .005 diameter should be punched from the back side so that locking fingers enter on the slightly rounded edge of the hole. Assemble proper compression washer and press into panel hole until locking fingers snap over hole edge. Installation pressure should be applied only at the circumference of the device.

ENVIRONMENTAL SPECIFICATIONS

Surge voltage
15% over maximum rated voltage applied for less than one minute.

Reverse voltage — DC models
Maximum reverse polarity equal to rated voltage for one minute. Some models may sound softly when subjected to reversed polarity voltage.

Life
Continuous — 100 hours continuous operation at 65°C with maximum rated voltage applied.

Intermittent — A duty cycle of 1 minute on, 5 minutes off, a minimum of 1000 times at room temperature and maximum rated voltage applied.

Storage temperature
−40°C to +85°C.

Operating temperature
−30°C to +65°C

Humidity
The Sonalert signal will operate after having been subjected to 95% Relative Humidity at +40°C continuously for 100 hours. After removal from test, the unit should be allowed to dry a minimum of 4 hours at room temperature before operation. Units will deliver original output characteristics.

Vibration
The Sonalert signal is to be mounted in the standard manner on a mounting panel. The specimens can be subjected to a harmonic motion having an amplitude of 0.03 inch (0.06 inch maximum total excursion). The frequency shall be varied uniformly between a limit of 10 and 55 Hertz. The entire frequency range from 10 to 55 Hertz and return to 10 Hertz should be traversed in approximately one minute. Motion is to be applied for two hours in each of 3 mutually perpendicular planes (total 6 hours). This test is to be conducted while the Sonalert signal is not operating. After completion of test, Sonalert signals will meet original specifications.

Salt spray
The Sonalert signal meets original specified operating conditions after being subjected to 96 hours in an atomized salt spray. The spray consists of a 5% salt solution atomized by a forced air supply. The solution is sprayed through a nozzle into a chamber maintained at 35°C. After the test, the unit is removed and washed in running water not warmer than 40°C. Use a soft hairbrush or plastic bristle brush, lightly brushing to remove salt deposits from the unit. The cleaned Sonalert signals are placed on absorbent material with the nose cone pointed downward and allowed to dry at room temperature for 24 hours prior to use.

Terminal strength
5 pounds, applied axially for a period of 5 minutes. This is considered a destructive test.

MMB-01 SERIES

ONE OF THE SMALLEST BUZZERS IN THE WORLD

Star's MMB series is the state-of-the-art in miniature electronic buzzers. Tiny size, high efficiency, and value are obtained through use of a custom IC. As all circuitry is solid state, the MMB's simplicity of design provides high reliability not found in conventional "make and break" type alarms. There are no mechanical points to arc or require maintenance, and RF noise is non-existent.

APPLICATIONS:

- Alarm Clocks
- Timers and Control Devices

SDB SERIES

Star's SDB series was developed as a simple solution to the most inherent design problem of electronic smoke detectors. Its proven technology combines value engineering, high reliability, and outstanding audio performance.

Typical CMOS smoke detector IC's or discrete transistors easily drive the SDB. A control or trigger terminal is built into the design. Transient protection is also included. Thus, systems users save money through elimination of SCR's, diodes, and other components.

As all circuitry is solid state, the SDB differs significantly from conventional "make and break" type alarms. There are no mechanical points to ignite hazardous vapors and cause explosions. RF noise, arcing, and electrical contact maintenance are non-existent.

Rich sound characteristics cover a spectrum of the most easily recognized frequencies. A warning signal is emitted that cannot be ignored.

Manufactured to Star's rigorous quality control and reliability standards, the SDB is guaranteed to meet or exceed UL 464.

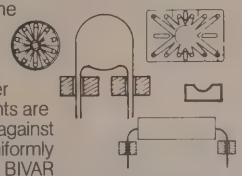
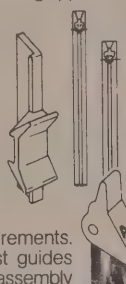
Can you find solutions to your design and cost problems from these standard Bivar Packaging Aids?

Yes. Because someone else probably had a similar problem before you did. In fact, during the past decade BIVAR has introduced *nearly 1,000 standard products,* most designed originally to solve costly Printed Circuit Board packaging or component mounting problems. These have resulted in lower assembly costs, fewer rejects and improved quality of product appearance and performance.



Take for example, the advantages of accurately supporting transistors, capacitors and other devices. Components are protected, insulated against heat damage and uniformly positioned by using BIVAR **PERMANENT MOUNTS** and **SPACERS,** made of durable Nylon per MIL-M-20693A. Hundreds of standard styles for virtually any PCB component; low-cost and carried in stock by the thousands. For accurate, uniform component spacing above PCB surfaces, over 400 standard sizes of BIVAR **WASH-AWAY SPACERS** assure proper filleting and heat dissipation, and eliminate lead stresses and strains, washing away in warm or hot running water without a trace of residue. These extremely low-cost devices, designed for exacting application for almost any component, substantially reduce rejects and rework.



BIVAR can mean the difference in cost-savings and *real* PCB packaging design flexibility with the industry's most complete line of **SNAP-IN CARD GUIDES;** lengths from 2½" through 14", made of reinforced molded Nylon. Snap them into card cages or sheet metal at *your* spacing requirements. For 1/16" PCBs, these low-cost guides feature rigidity, card insertion and assembly ease, and are stocked for immediate shipment.

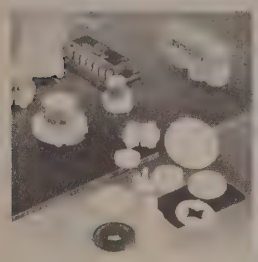
For new, demanding designs, BIVAR Flame Retardant Card Guides offer the same range of sizes made of 94 V-O U.L. rated material; help the designer to meet flammability specifications. New *Deep Channel Card Guides,* with a .200" slot depth for maximum retention under shock and vibration or for larger PCBs. All stocked at low, cost-savings prices.

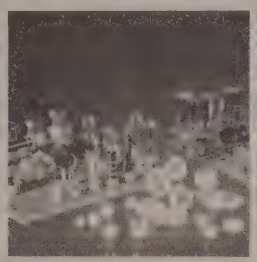
Components, circuitry and cards will be protected from undue stresses, and PCB insertion or removal will be easier with BIVAR **CARD EJECTORS,** designed for 1/16", 3/32", and 1/8" boards; 18 styles, including locking versions to prevent accidental card release. Molded from Nylon per MIL-M-20693A, and U.L. rated 94 V-2 material, these helpful ejectors meet most demanding requirements. Ejectors can be marked permanently for identification, are available in 13 standard colors and are furnished with stainless steel mounting pins.

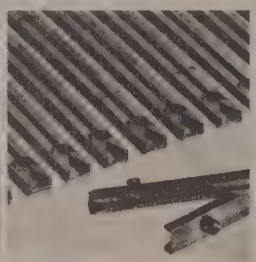
BIVAR PCB HANDLES make circuit board handling easier and provide an excellent way to

to code or identify each board. Made from Natural White Nylon per MIL-M-20693A and U.L. rated 94 V-2 material, they meet demanding packaging specifications; standard colors and markings are available.

Yes, you can find solutions to *your* design and cost problems from this growing family of Packaging Aids. And, if you have special needs they can be answered too.







Whether you are mounting components on PCBs, or packaging completed PCBs, BIVAR can provide answers that will save time, money, and improve your product's appearance. Find out about the BIVAR *"Cost Savers."* Choose from over 900 standard products.

ECS transit, carrying, and operating cases provide maximum protection for precision equipment and sensitive instrumentation during transport and field operation. These cases are pressure molded fiberglass, using a technique that maximizes the glass content of the laminate, resulting in exceptional strength and impact resistance. Engineered specifically to withstand rough handling and hostile environments, they will meet all applicable military specifications, afford protection over a −65° F to +160° F temperature range and exceed military requirements for tensile, compressive, and flexural strength. These cases are impervious to moisture, corrosion, and fungus growth.

Offered in 1200 case sizes by part number, in a choice of 30 standard colors, ECS cases and cabinets are available to meet your specifications for the transportation and field operation of your equipment. Custom designs are available for special applications.

These enclosures have been proven in the severest environments, successfully protecting such equipment as military calibration systems, offshore instrumentation, flight line equipment, television and other communications equipment, electro-optical equipment, minicomputers and peripherals, time and frequency standards, dental, medical and surgical equipment, precision tools, and electronic test and measurement equipment of all kinds.

HOW TO SELECT CHASSIS-TRAK SOLID BEARING SLIDES

Slides are furnished in pairs, with each right and left slide consisting of a stationary section, a corresponding intermediate section and a chassis section. Most solid bearing slides are available with a choice of three stationary sections (determined by the type of mounting), a single intermediate section (used for all combinations), and a choice of four chassis sections (determined by the need for easy access to chassis for servicing). A Quick-Disconnect system standard on all Solid Bearing slides, permits the chassis to be removed quickly and easily from the cabinet for servicing when necessary.

LINEAR BALL BEARING SLIDES

Designed for especially smooth travel and extra long life under maximum loads, these slides are made of cold-rolled steel and operate on carbon steel ball bearings. Available in several models, with optional cabinet mount and/or lock-out. Write for Catalog CT185.

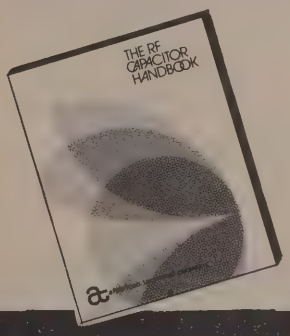
ATC UHF/MICROWAVE CHIP CAPACITORS

American Technical Ceramics, the recognized leader in RF capacitor technology, offers a product line of outstanding quality and reliability to meet the most demanding requirements of the design engineer.

Unique features of construction, enforced by the highest quality control standards, are responsible for the consistent quality and high performance of ATC porcelain and ceramic capacitors. ATC capacitors are available in a wide variety of sizes and styles, and there is a capacitor to meet the requirements of almost any design application.

The severe thermal shock to which capacitors are subjected by direct soldering during circuit assembly can destroy the integrity of conventional capacitors, permitting flux and solvents to penetrate the dielectric. ATC porcelain capacitors have outstanding reliability and ultra-stable performance due to their hermetic, self-encapsulated porcelain construction. Rare metal internal electrodes are molecularly bonded and sealed in a monolith of non-porous porcelain, providing a rugged and hermetic structure that is not degraded by the circuit assembly process. ATC's design of the chip capacitor internal structure has resulted in the most reliable porcelain capacitors available proven by extensive testing programs of approximately 2 million component hours per month.



The ATC barrierCap™ termination is now standard on all pellets and leaded capacitors. The terminations remain intact under the most severe thermal shock, and are not dissolved away even by the most careless soldering. They easily withstand a 5 minute submersion in 375° solder pot without leaching, while retaining complete solderability. Migration is virtually eliminated and a bond strength greater than 30 lbs. is typical for "B" Case capacitors (110 mils square) with nail head leads.

Laser Marking is available on ATC capacitors for quick and complete identification of capacity value and tolerance. This highly legible and permanent marking results in no degradation of performance or reliability and is impervious to all cleaning solvents.

The RF Capacitor Handbook presents over 250 pages of comprehensive detail design considerations and uses for miniature chip and leaded RF capacitors. You'll find theoretical and empirical high-frequency circuit design equations, especially at high RF power levels and frequencies, actual test data at frequencies from 100 MHz to 3 GHz, and practical design methods for increasing gain and power, DC to RF conversion efficiency, bandwidth, transistor lifetime, circuit MTBF, and low-noise performance. DRIMICA CAPACITORS

Axel Mylar*Wrap D-C Capacitors employ a dielectric system of reconstituted mica paper impregnated with a thermosetting resin. The outer wrapper is heavy gauge Mylar* and the ends are filled with a high quality epoxy. The capacitors are normally supplied with .040" diameter solder coated copper terminations. Other configurations are available as indicated on page 4. These capacitors are ideally suited for power supply filters, by-pass and coupling-blocking applications.

Axel Flat Disc Capacitors employ a dielectric system of reconstituted mica paper impregnated with thermosetting resin and encapsulated in epoxy. This method of construction insures low self inductance by elimination of unnecessary case insulation and high voltage oil seal bushings normally encountered in other forms of constructions.

The flat configuration lends itself to stacking of capacitors to achieve higher voltages in reasonable heights. The round design permits co-axial return discharge paths and the open inside diameter provides further versatility to the user.

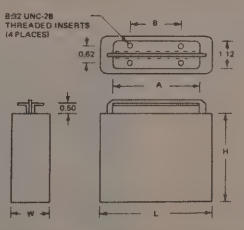
LOW INDUCTANCE ENERGY DISCHARGE CAPACITORS/SERIES ME6E



Axel Flat Line Capacitors make available a series of low to intermediate energy discharge low inductance capacitors employing a dielectric system of reconstituted mica paper impregnated with thermosetting resin and encapsulated in epoxy. This method of construction insures low self inductance by elimination of unnecessary case insulation and high voltage oil seal bushings normally encountered in other forms of construction. The terminals of these units are ideal for connection to a continuing parallel plane transmission line (flat line).

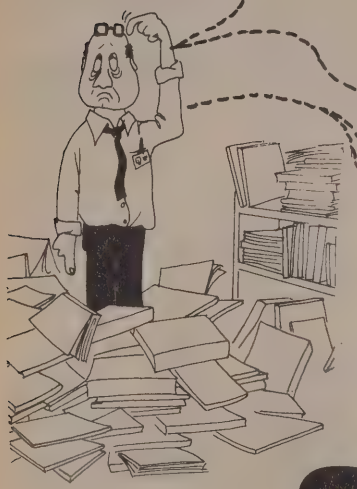
What can I use to keep all the manufacturers' product data I receive in order?

What system makes filing or retrieving manufacturers' catalogs fast and easy?



Which file system have thousands of engineers purchased because they know it works?

eem FILE SYSTEM

THE ONLY FILE SYSTEM DESIGNED SPECIALLY FOR THE ELECTRONIC ENGINEER!

The publishers of **eem** have put together a unique filing system for electronic product information. The complete system includes: a product index booklet which classifies electronic products into 3,000 listings both alphabetically and by product group, and 45 file folders imprinted with the **eem** product sections (extra gummed labels included for expanding the system.)

As you receive manufacturers' catalog data sheets, technical bulletins, or clip magazine articles, jot down the proper Product Section Numbers from the **eem** PRODUCT-TO-SECTION INDEX. Then simply file in order. When you require information on a specific product, refer to PRODUCT-TO-SECTION INDEX again to locate the correct file folder. It's simple, and you'll always have the necessary data to compare, specify and buy, right at your fingertips.

Here's how to order your eem FILE SYSTEM:

For the complete system send $10 (plus tax; N.Y., 8%, CA, 6½%) in check or money order to:

United Technical Publications, Inc.,
645 Stewart Avenue, Garden City, N.Y. 11530
Att: Circulation dept.

For an **eem FILE SYSTEM** without file folders send $7.50 (plus tax; N.Y. 8%; CA, 6½%).

CDT SERIES
EPOXY DIPPED SOLID TANTALUM CAPACITORS

INTRODUCTION

CAPAR's Solid Tantalum Capacitors are manufactured for both high reliability over the temperature range of −55°C to +85°C, and low cost. Their external coating is an advanced electrostatic epoxy powder which can endure severe moisture.

Type CDT Capacitors are ideal for many applications where low cost, high capacitance, and small sizes benefit the product. The long life and stability of solid tantalum reduces servicing and will insure customer satisfaction in your product.

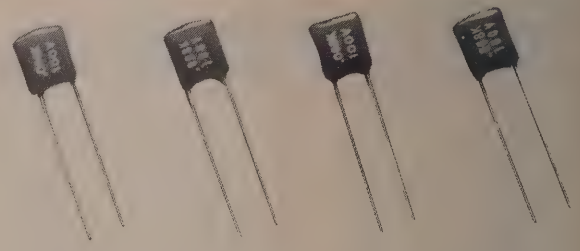
CEM SERIES
SUBMINIATURE POLYESTER FILM

INTRODUCTION

The CEM Subminiature Polyester Film Capacitor is suitable for easy insertion in PC boards. They are protected against moisture and soldering iron contact by four coatings of epoxy. The capacity and voltage are printed by thermo setting onto the body of the unit to insure legibility after production handling. The CEM capacitors may be used in many applications, such as filtering, bypass, coupling, low volt vacuum tube or transistor circuits, etc., in entertainment and commercial equipment. These capacitors may be operated at 85°C at full rated voltage.



We can supply lead spacing to your specifications.

CHIP CAPACITORS

Micro-miniature devices designed for use in thick film, thin film, and other hybrid applications, each with a selection of terminations available to solve the most complex bonding problems. Ideal where small size, high stability, excellent performance, and reliability are required, as well as negligible lead inductance and extremely high Q at high frequencies.

GLASS SEALED DEVICES

Glass sealed capacitors available where reliability requirements increase, but keeping production costs at reasonable levels. To meet your production needs Centre Engineering offers you our newest member of our growing line of capacitors, the glass sealed multi-layer capacitors in strip form. Small in size and hermetically sealed, these capacitors are rugged, reliable, and ideal for automatic insertion.

CDE CORNELL-DUBILIER

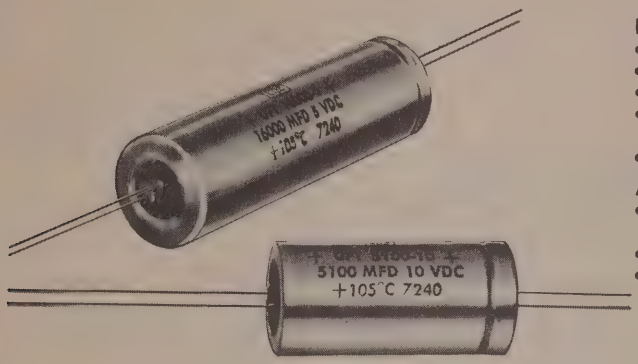
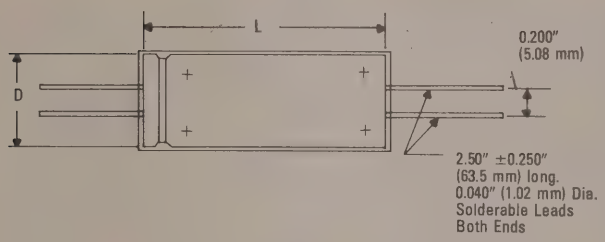
Class 201.68

Types UFT/UFTA

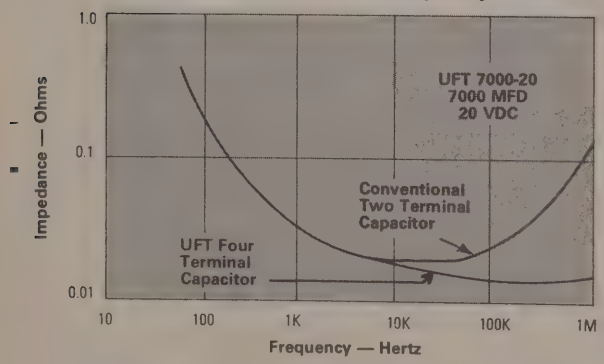
EXTENDED TEMPERATURE RANGE, LOW IMPEDANCE, HIGH FREQUENCY (−55°C to +105°C)



Outline Drawing



Typical Impedance vs. Frequency Curve



FEATURES

- Ultra low impedance above 10KHz
- Broad temperature range
- Low ESR (Equivalent Series Resistance)
- Shock and high frequency vibration resistant
- UFT* has No. 18 AWG and UFTA* No. 16 AWG leads

APPLICATIONS

- Designed for switching regulator power supplies
- High gain amplifiers
- Critical circuits where operation at high frequency is necessary yet still have a high degree of reliability and low failure rate under adverse environmental conditions.

The unique four terminal construction and internal assembly techniques dramatically reduce the inductance to approximately one nanohenry. As a result, the impedance does not increase at frequencies above 10KHz, but actually decreases to a value approximately equal to the ESR and then remains essentially flat as shown in the impedance-frequency curve. These capacitors also provide effective isolation of the load from the power source.

In a typical switching regulator power supply, UFT and UFTA capacitors perform the following functions:

1. Adequately filter the fundamental frequency ripple current.
2. Localize and filter the high frequency megahertz ripple.
3. Prevent high frequency noise from feeding back into the power line.

The UFT and UFTA are designed for continuous duty operation over the temperature range of −55°C to +105°C (−67°F to +221°F). They are shock and vibration resistant and unaffected by chlorinated cleaning solvents.

Capacitance ratings available are 50 to 16,000 Mfd. Voltage ratings available are 5 to 200 VDC at 105°C. The maximum capacitance change from the 25°C value over the temperature range of −55°C to +105°C is ±25%.

Unlike conventional axial lead capacitors, the DC current flows through the aluminum rods located in the center of the capacitors. Under certain conditions, up to 45 amperes DC load current can be handled. This current is limited by the temperature rise due to the DC load current and ripple current, the ambient temperature, and external loads.

The capacitors are capable of withstanding a minimum of 2000 hours life test at rated DC voltage and ripple current at 105°C.

*Patent pending

CAPACITANCE CHANGE WITH TEMPERATURE:

The maximum capacitance changes from measured +25°C values are:

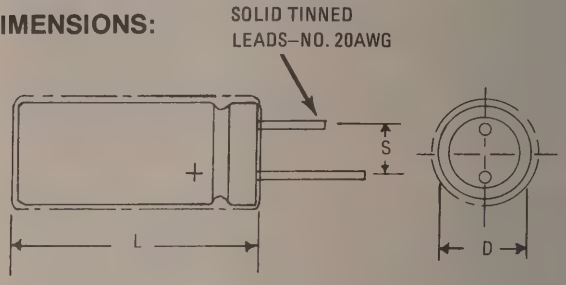
DIMENSIONS:



Type UPC Capacitors provide low impedance for high frequency filtering through 1 MHz. They typically exhibit series inductance of less than 12 nH and ESR of about ½ standard industrial-grade miniature aluminum electrolytics. The UPC is an excellent choice as an output filter capacitor in a low-power, low-voltage switching supply. Although the filtering impedance is significantly higher than a comparable UFT above 150 kHz, the UPC's lower cost makes it an appropriate choice for applications without stringent EMI requirements. It is especially recommended for high frequency applications like switching regulators but it's rugged construction and wide temperature range make the UPC the right choice for many industrial applications.

The UPC is a polarized single-ended, aluminum electrolytic capacitor with an advanced wide-temperature electrolyte. Typical frequency performance is shown at the right and Standard Ratings and characteristics appear on this and the following page.

COMPUTER GRADE, SCREW TERMINAL, LOW IMPEDANCE (−40°C to +85°C)

Developments by CDE in low resistance electrolytes and paper separators, combined with increased quantity of multiple anode and cathode tabs welded to the terminals, have resulted in very low ESR capacitors.

Another advantage of the design of the FAM is lower impedance at high frequencies, which is important for high ripple current applications such as switching power supply filtering.

The "low screw" terminals are tapped to accept 10-32 screws furnished with each capacitor.

The operating temperature range of this capacitor is from −40°C to +85°C (−40°F to +185°F)

The ratings shown are the highest nominal capacitance for each case size in the standard FAM line. Intermediate, unlisted values are also available.

CDE CORNELL-DUBILIER

Electrolytic Capacitors, Aluminum

COMPUTER GRADE, SCREW TERMINAL, EXTENDED CAPACITANCE, COMPUTAMITE® (−40° to +85°C)

The ratings shown are the highest nominal capacitance for each case size in the standard line. Intermediate, unlisted values are also available. The FAHM has "high screw" terminals, the FALM has "low screw" terminals, and both have tapped terminals to accept 10-32 screws furnished with each capacitor.

CDE's FAHM and FALM "Computamite" electrolytics are extended capacitance units with ratings which exceed those of the FAH and FAL. They are reliable, long-life capacitors designed for power supply filtering, industrial control equipment, energy storage, and other applications where the smallest size with high mfd x volts are important. These units are designed for continuous duty operation over the temperature range of −40°C to +85°C (−40°F to +185°F).

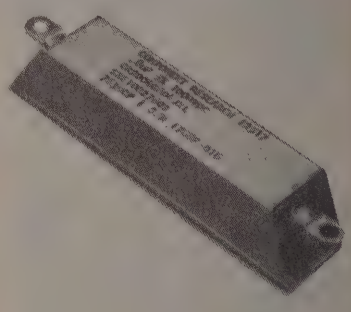
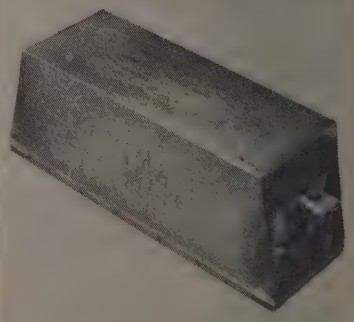
CRC hermetically sealed plastic film capacitors are acknowledged world wide as the highest quality and performance type available. Standard tubular metallized polycarbonate capacitor, AC rated to 40KHz and qualified to MIL-C-83421/01 is shown here.

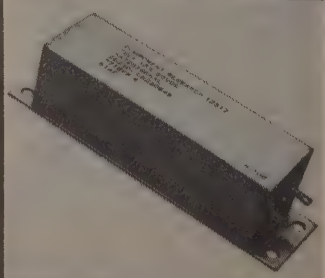
Type 55 foil polypropylene capacitors are used in power resonating applications up to 160KHz and with fast switching, high peak current devices. A typical 10uF capacitor in a 1.25″ diameter x 3.375″ length can handle up to 50A rms under continuous duty operation. Its ESR at 100KHz is approximately 0.0016 ohms which is typical of the low loss inherent in these capacitors.



CRC square profile capacitors are designed for thermal conduction to heat sinks in space operation. They are used where high energy current handling, low power loss and minimum heat rise is required in a vacuum environment. CRC capacitors can virtually change power loss from watts to milliwatts for critical applications.

Aircraft EMI Filtering: The custom capacitor shown weighs less than 2 pounds and handles 115A feedthru current in addition to 30A of reactive current. The capacitor is rated 120uF at 140V rms at 125°C and is specially constructed of metallized polysulfone to withstand possible internal worst-case heat rise of 150°C in operation. The attenuation is remarkable for this type product and is used in the F18 Aircraft Program for 400Hz line filtering.





This 75uF, 50VDC, metallized polycarbonate capacitor is 1″ square by 3¾″ long and is rated at 10A rms at 25KHz at 100°C. Each capacitor receives 168 hours of AC voltage at 25KHz to produce 10A rms in combination with 50VDC applied during burn-in at 100°C.

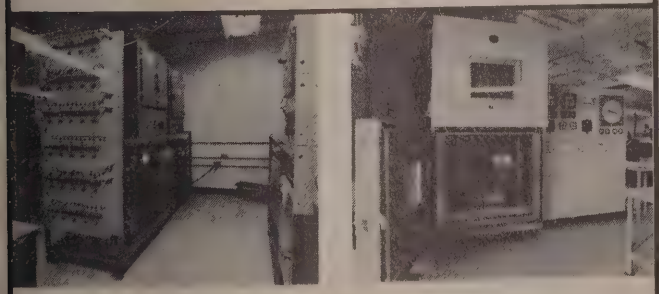
WINDING DEPARTMENT: CRC manufactures special winding machines to produce their unique rugged winding sections. Rigid quality control is enforced to achieve highest standards of performance and uniformity.

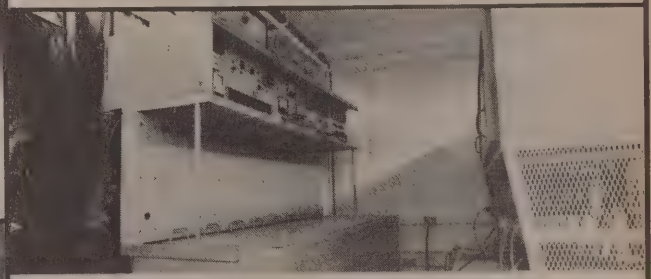
CAPACITOR ASSEMBLY DEPARTMENT: Ideal assembly conditions are achieved by air conditioning and natural lighting combined with high intensity background lighting.



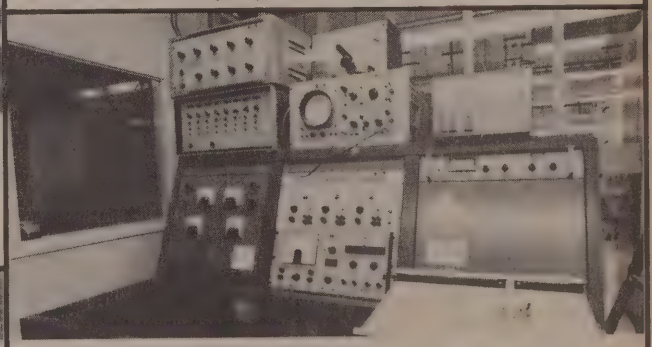
BURN-IN AND TEMPERATURE CYCLING: CRC capacitors receive 100% burn-in before and after installation in their hermetically sealed cases. 100% thermal aging or shock is performed prior to seal tests. Burn-in ovens are shown above left. CRC has over 1000KVA of unique AC generators operating from 400Hz to 100KHz for AC burn-in of capacitors.

The 12 foot high shock chamber above right, was used to qualify CRC metallized polycarbonate capacitors for 500 shocks from −55°C to +125°C in the space shuttle program. CRC has over 200 cubic feet of thermal shock and aging work space available for 100% processing of capacitors.

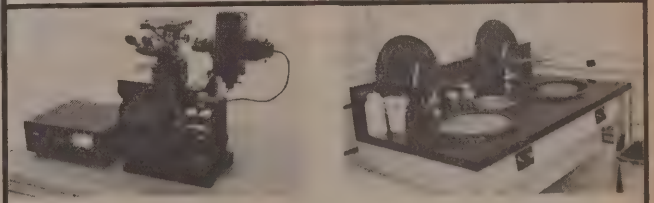
CALIBRATION EQUIPMENT: One out of approximately four employees is dedicated to quality control, assurance, and inspection. Hundreds of precision instruments for parametric measurement are maintained under constant calibration. CRC supplies capacitors for laboratory standards use throughout the world.



LIFE TEST CHAMBERS: At CRC Life Testing is a way of life. In CRC test facilities, over 10,000 capacitors are in life test 24 hours a day, every day of the year. For MIL-C-83421 retention of qualification, for special programs and for CRC research needs, life tests are conducted under DC, AC, and combined AC and DC life.



ENVIRONMENTAL TESTING: Vibration, shock and many other stress tests are conducted in our modern qualification laboratories where capacitance parameters can be accurately monitored for sensitive changes to study how our products can constantly be improved.



PARTS DISSECTION ANALYSIS: CRC conducts in-house potting grinding, polishing, and dissection of samples periodically taken from production to study possible failure modes and for general information use. Metallurgical microscopes, grinding and polishing equipment together with various specialized instruments permit thorough analysis and quality assurance control of total production.

CRC ESTABLISHED RELIABILITY CAPACITORS

SPECIAL SCREENING FOR CRITICAL APPLICATIONS

Component Research capacitors are used in critical applications where their reliability and performance can affect the success of an entire program involving years of preparation and billions of dollars of program cost. For over a decade, aerospace programs from Apollo to Viking have used CRC capacitors for timing circuits and other control circuits, essential for controlling spacecraft millions of miles from earth, after years of space travel.

You can depend upon CRC to provide the most reliable capacitor and screening plan for your critical applications. Following are typical screening plans for standard and special applications.

VIKING QUALIFIED POLYSULFONE

A specially screened G14 type has been supplied for the Viking space program which must withstand 135°C sterilization temperatures for 600 hours, very high levels of shock and vibration, and then perform in a very high impedance circuit at low voltage levels without intermittent conditions developing. During such tests some capacitors have been observed to develop problems at low temperature and special screening methods are used in this super-critical application to 100% monitor for breakdowns during temperature cycling.

400 HZ AC BURN-IN

R12 Polycarbonate capacitors are the same as the series K12 capacitors listed in the catalog except for 100% AC burn-in at 140% of rated RMS volts at 400 Hz for 16 hours at 100°C. The 400 Hz AC testing is becoming popular as a means of achieving high reliability in aircraft programs where a faulty capacitor could lead to serious consequences. The R12 type of screening will ultimately become a standard burn-in method of testing AC capacitors for MIL-C-83421. 100% recorded readings of capacitance, dissipation factor, and insulation resistance, can be provided, before and after burn-in.

40 KHZ BURN-IN & CORONA SCREENING

Type BF51 teflon foil capacitors are being used in a high frequency switching application with a rise time of less than 1 microsecond, in a limited space. Typically a 0.025 uF, 400 VDC rated teflon foil, oil impregnated capacitor operates with; 200 volt peak to peak, 10 KHz square wave voltage conditions, a rise and fall time of 100 nanoseconds, in a 0.312 x 1.063 case. Under these conditions this teflon capacitor is relatively cool with peak current of 30 amps developed at a 20 KHz repetition rate.

Following is the 100% screening used for this AC application.

1. **Burn-in** for 48 hours at 125°C. Apply 180 VRMS at 40 KHz ±5%.
2. **Thermal aging** temperature cycle 5 times −65°C to +125°C. Per MIL-C-83421.
3. **Seal Test** Bake for 4 hours at 125°C. Check for oil leakage or visual damage.
4. **Corona Test** Apply 400 VRMS at 60 Hz and check for evidence of corona inception.
5. **AC Stress Test** Apply 100 Hz square wave voltage, terminal to terminal, for 1 minute, per MIL-C-83421/1, at 1000 volts peak to peak.
6. **DC Hipot** Apply 800 VDC terminal to terminal and to case at 25°C for 1 minute, per MIL-C-83421.
7. **Insulation Resistance** when measured wtih 400 VDC at 25°C, 1,000,000 megohms minimum.
8. **% Capacitance** at 1 KHz.
9. **% Dissipation factor** at 10 KHz, 0.01% maximum.
10. **Final visual** and mechanical inspection.

40 KHZ AC BURN-IN

Special 40 KHz burn-in for type 12 polycarbonate capacitors is available at maximum rated conditions of the RMS AC voltage conditions of Table I of MIL-C-83421/1. Typically, a 0.1 uF, 30 VDC rated type C12A104 or A12A104 is receiving 10 volts RMS AC at 40 KHz, at 100°C, for 168 hours, a special screening for the Trident program.

SCREENING FOR SPACE APPLICATIONS

Type J11 teflon and J12 polycarbonate capacitors receive 96 hours burn-in and other screening conditions as required by JPL for their space applications. If you have a JPL or similar space agency subcontract, we will be happy to coordinate capacitor specification preparation to facilitate procurement with minimum delay and effort.

105°C SCREENED POLYSTYRENE CAPACITORS

Series L53 105°C screened polystyrene capacitors are one of the many unique Component Research capacitor products which demonstrate CRC superior performance and outstanding quality. The following screening plan for a space application is typical of the many custom screening procedures we have available for the most critical and sophisticated applications.

GENERAL PRODUCT INFORMATION

ORDERING INFORMATION — Terms: Our terms are net 30 days to customers approved by our credit department. All shipments are F.O.B., Santa Monica, Calif. **Delivery:** Most items listed are available from stock or within 10 weeks for quantities up to 1000 pieces. **Minimum Order:** Minimum billing per order is $30.00. **Complete Part Number:** Please make certain that you have complete part number to avoid any errors or delays. Please check part number instructions in individual specification pages.

PATENT INFORMATION — CRC capacitors are exclusively manufactured under one or more of the following patents and additional patents pending: 3,238,428; 3,260,906; 3,292,063; 3,506,895; 3,539,886; 3,603,849; 3,626,362.

CONSTRUCTION INFORMATION — All standard capacitors listed are hermetically sealed after vacuum process and both gross leak and helium leak tested for true hermeticity. Unless otherwise specified all parts listed are metal cased, tubular, with both wire terminals isolated from the metal case.

PART NUMBER OBSOLESCENCE — Due to changes in military specifications for which we are qualified, upgrading of our catalog specifications, or size reduction, part numbers formerly used may now be obsolete. We urge our customers to change their existing drawings to indicate the new part numbers for old and new design, wherever possible. If you are unable to make this change, CRC will continue to supply and mark parts indefinitely to the old specifications.

INSTALLATION INSTRUCTIONS — To prevent damage to the hermetic seal joint, use a tweezer type heat sink between the soldering iron and solder beads when soldering within ¼" of beads. Prior to lead bending or twisting, protect glass seals and solder joints by gripping with a small pliers, area of leads near solder beads.

Contaminating films on the glass seal surfaces may occur during customer handling and installation of capacitors. To preserve the high insulation resistance inherent in CRC capacitors, clean the glass seal surfaces thoroughly with acetone or chlorinated hydrocarbon fluid.

CAPACITOR MEASUREMENT INFORMATION — The high quality of CRC capacitors may be difficult to evaluate unless sufficiently sensitive and accurate equipment is utilized in conjunction with proper measurement techniques.

Capacitance bridges equal to the General Radio 1620A are recommended for best accuracy of capacitance. This bridge is satisfactory for dissipation factor measurement of capacitors up to 1 uF. CRC has developed a special bridge capable of accurately measuring dissipation factor of capacitors up to 100 uF or more at frequencies up to 1KHz. For inspection of DF of larger than 1 uF capacitors it is suggested that you use samples correlated by our measurement laboratory.

Insulation resistance measurement is performed by Component Research Co. using leakage current methods which are repeatable to 1 picoamp for capacitors less than 0.1 uF. Larger values require adequate charge time to minimize dielectric absorption effects. Guard boxes are used to perform leakage current and dielectric absorption measurements.

SPECIAL MATCHING — We can assort capacitors into sets of two or more capacitors matched for capacitance value within ±0.1% of each other at nominal cost. Where capacitors must track with temperature, they can be supplied in matched sets as closely at ±0.1% over their temperature range. Capacitors of opposing temperature coefficient slopes can be supplied to obtain lower temperature coefficients than for standard types.

SPECIAL CAPACITOR VALUES — If your application requires odd values such as 0.10015 uF ±0.1% or 0.9999 uF ±0.25%, such requirements are readily met from our large stock of standard and non-standard values. Individual capacitors can be permanently marked or tagged with discrete values accurate to six places if required.

SPECIAL VOLTAGE RATINGS — Problems of size may occur when replacement of a poor quality capacitor is required. Under certain conditions such as restricting the operating temperature, or limiting DC hipot to 150% of rated volts, a substantial size reduction is possible. Check with our applications engineering department for our recommendations in such cases.

SPECIAL PART NUMBER IDENTIFICATION — CRC believes that there is a sufficient choice of capacitors in this catalog to satisfy virtually all applications. In the event you have any requirement involving a modification of our specifications, the following special identification will be used.

Example: X11B154BW588 (typical special part number). "X" preceding the part number indicates a special customer requirement. The number group at the end of the part number is assigned as a unique identification of the special manufacturing and inspection instructions. In example shown, "588" is a typical unique identification number.

CRC ESTABLISHED RELIABILITY CAPACITORS

OPTIONS AVAILABLE FOR STANDARD CAPACITORS

CRC can supply the standard capacitors listed in this catalog with more closely specified limits and with special characteristics by additional processing, screening, and selection. Following is a list of some options and characteristics available when you are required to meet special design or operating conditions.

LINEAR TC SLOPE FOR RESISTOR MATCHING

CRC series A95 polystyrene capacitors provide the closest approximation to a straight line plot for capacitance vs temperature over the range of −50°C to +85°C, with less than 150PPM/°C in negative slope. Larger capacitor values appear to have lower TC than smaller capacitor values. Typically values ranging 0.01uF average −100 PPM/°C and 1.0uF range −40PPM/°C. The normal worst case limits in non-linearity of TC slopes are ±50PPM/°C for all A93 polystyrene capacitors. Slopes are available as low as ±10PPM/°C for the full temperature range of −50°C to +85°C. This slope is a permanent characteristic and will remain constant with temperature cycling and time.

CRC series A95 metallized polypropylene capacitors have a more negative slope, generally −300PPM/°C with linearity limits of ±50PPM/°C. CRC foil polypropylene capacitors which are not oil impregnated generally have a TC slope of −225PPM/°C. Foil capacitors also have a greater dielectric hysteresis than metallized types which evidences itself by a capacitance shift at 25°C when a capacitor is alternately cycled from cold to hot temperatures.

Typically this offset is from 0.01% to 0.15% for metallized capacitors when measured at 25°C after exposure to −50°C and +125°C. Foil capacitors usually have an offset of 0.05% to 0.25% under the same conditions. Operation over a more limited temperature range results in a reduced offset.

CRC can provide capacitors with minimum offset and specific linearities and slopes by 100% screening and selection.

±10PPM/°C TRACKING MATCHED CAPACITORS

In some applications it is desirable to have several capacitors of the same value track together over a specified temperature range.

Frequently good linearity is not mandatory provided all capacitors although non-linear, follow the same pattern of varying in capacitance with temperature. In other applications a set of different capacitors must track within a defined ratio limit of each other as temperature changes.

From its large stock of 100% screened and batch controlled high reliability capacitors, CRC can furnish many combinations of desired matched capacitors in a minimum of time.

MATCHED SETS TO ±0.05% ACCURACY

CRC can provide matched sets of two or more capacitors with readings of ±0.05% of each other although the purchase tolerance is as high as ±1%. This is more economical than purchasing individual capacitors to ±0.1% or ±.25% tolerances.

0.003% DIELECTRIC ABSORPTION CAPACITORS

Special teflon capacitors having less than 0.003% dielectric absorption are available for minimum offset error in sample and hold type applications.

In one special application 1uF teflon capacitors are 100% screened by viewing their individual slopes of recovery voltage on an oscilloscope. These capacitors receive a 10 volt peak pulse, ten milliseconds wide, with a 1 millisecond discharge time. The oscilloscope indicates the recovery voltage for an additional 100 milliseconds. This test method more closely approximates fast switching application conditions than the dielectric absorption test methods covered in military specifications.

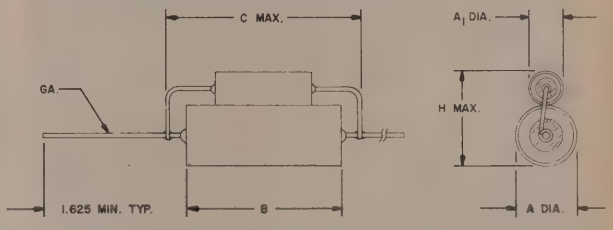
ZERO TEMPERATURE COEFFICIENT BY TC MATCHED PAIRS

It is difficult to obtain zero TC over a wide temperature range but over a more limited range CRC can provide a TC as low as zero ±5PPM/°C by pairing two **capacitors** with opposing slopes. Typically an A93 polystyrene capacitor matched with the same value A12 polycarbonate capacitor will match to zero ±30PPM/°C from −10°C to +85°C, as off the shelf purchased items.

If lower TC than this is required, we can 100% measure and match for closer temperature coefficient.

"PIGGYBACK" PERMANENTLY CONNECTED MATCHED CAPACITORS

Customers sometimes prefer the matched capacitors connected together as one to prevent their separation prior to installation. CRC standards are made by "piggyback" connection of trimmers which can provide accuracies to ±0.05%. Shown below is a figure of a "piggyback" connected matched capacitor.



50,000,000 MEGOHMS INSULATION RESISTANCE

This may seem incredible but CRC is supplying special 1uF teflon capacitors which measure up to 5,000,000 megohms at 100°C, and up to 50,000,000 megohms at temperatures from 25°C to −40°C.

CRC is developing new methods of measuring to higher levels of insulation resistance and believes it will be able to verify that specially selected smaller values such as 0.1uF can be supplied to meet a specification of 500,000,000 megohms. When you use capacitors in such sensitive applications certain errors and disturbances not normally observed become visible. Some of these are described below.

LOW "PIEZO ELECTRIC LIKE" VOLTAGE GENERATION CAPACITORS

When capacitors are subjected to a temperature change they generate a voltage which may vary from capacitor to capacitor in a lot and from one style of capacitor to another. Voltages up to ten millivolts per °C have been observed and the voltage output generally does not increase linearly with temperature. In some cases there actually will be voltage reversal during a temperature run in a given direction.

If the capacitor is not connected to a high impedance measurement device during the tests this voltage output may not be seen as it will be discharging through the low resistance input of ordinary voltmeters if these are being used for measurement. CRC supplies specially selected 0.5uF, 50VDC teflon capacitors similar to the J11B504 style to meet a requirement of 0.5 millivolts maximum/°C voltage generation, for a critical application.

FAILURE ANTICIPATION, AND IMPROVED CAPACITOR RELIABILITY WITH 100% SCREENING

CRC ESTABLISHED RELIABILITY CAPACITORS

Plastic film dielectric type capacitors can provide remarkably good electrical characteristics and high reliability but it takes a combination of sound construction, suitable film quality, exacting process control, and 100% testing to achieve this.

We are listing below some pitfalls to avoid because we are concerned with a proliferation of marginal quality capacitors frequently used in high reliability level aerospace and industrial applications. Additional information appears on page 1107.

MIS-APPLICATION OF CAPACITORS IN AC CIRCUITS

■ The highest quality capacitor will fail if you are exceeding its ratings by subjecting it to excessive voltage and current stresses. In sinusoidal applications metallized capacitors that warm up over 20°C after several hours of operation are considered a borderline case, and you may be applying too high an RMS voltage or frequency.

■ If the capacitors you are using have higher than normal dissipation factor readings, this may be a sign of high series resistance caused by poor terminations on the capacitor section. The square wave AC screening for one minute covered in MIL-C-83421/1 is a good way of eliminating capacitors with gross dissipation factor quality.

■ If dissipation factor limits are set too high as post test requirements, suspect capacitors will pass the square wave test. In fact terminations may have been damaged by this test, but are permitted to pass what we consider are abnormally high DF limits. A termination that is poor at room temperature generally should be worse at higher temperature and increased heating caused by power loss at the terminations may cause ultimate degeneration and possible failure.

■ We consider 100% AC burn-in at elevated temperature an excellent method of checking for good terminations. Burn-in should be followed by 100% dissipation factor examination.

■ In SCR commutation and transistor switching type applications, heat rise of a metallized capacitor is not always a good means of determining if the capacitor can handle the non-sinusoidal current pulses usually encountered if the capacitor is subjected to relatively high peak currents at a low duty cycle. Capacitor may suddenly open after hours, possibly months of operation, while never having shown more than a few degrees of warm-up during operation.

■ A recent example of operating beyond specified limits resulting in ultimate failure is shown by the following experiment performed on three 0.033uF, 30VDC, Type E12A333, metallized polycarbonate capacitors.

The capacitors were placed in parallel to form a 0.1uF load into the output of a CRC designed power generator supplying a 60 volt peak to peak square wave at a 20KHz repetition rate.

An examination of the current pulses developed indicated that the capacitors were handling a peak current of 8.4 amps with a cosine type waveshape having a 1.2u second width at the base.

The capacitors were operated for 100 hours at 25°C with less than 2°C heat rise. If we compare the MIL-C-83421/1 rated current at 40KHz of 0.18A rms maximum for a 0.033uF 30VDC capacitors, with the peak current of 2.8 amps during this test, it appears that these capacitors can handle this level.

A more conservative level which we intend to verify by long term is 1.8 amps maximum peak current based on a peak current not to exceed ten times the 40KHz RMS rated current of 0.18A for this capacitor. After increasing the square wave voltage to 80 volts peak to peak, the capacitors opened up.

The peak current during this test period was approximately 3.8 amps which is more than twenty times the RMS rated current of 0.18 amps. This is an example of how much higher in peak current CRC capacitors can be stressed, but certainly we do not recommend that you go to extremes in using these capacitors.

■ We recommend that you send us your oscilloscope current and voltage waveforms for analysis if you have non-sinusoidal applications.

■ As an example a 0.1uF 100VDC rated A12C104 or K12C104 capacitor maximum rated at 0.9A RMS could be operated with 9 amps of peak current provided you did not exceed a 10KHz repetition rate.

■ Additional AC pulse data appears on pages 1102 and 1109.

CAPACITOR OPENS & INTERMITTENTS AFTER ENVIRONMENTAL TESTING OR LONG TERM STORAGE

■ CRC has frequently been requested to replace "Brand X" metallized capacitors (which may have cost 50% less). Problems began to plague production lines long after being qualified for the application and long after passing initial breadboard and preproduction tests.

■ Unfortunately many specifications and programs do not take time into consideration. Capacitor terminations may withstand DC burn-in, DC life, and even AC life but may start to break down as a result of expansion and contraction of all the metal and plastic materials involved in the construction of a capacitor.

■ The extreme differences in dimensional change between plastic and metal materials as a result of temperature cycling may result in microscopic ruptures of termination joints, possible electrode oxidation and generally unstable termination series resistance.

■ Component Research Company patented stress free termination design and precise quality control eliminates the above problems. This is the reason we recommend 100% temperature cycling or thermal aging followed by screening as described above.

■ Our goal is to continue to provide increasing amounts of detailed information and data of this type. In this manner the reliability and safety of electronic equipment needed for military and commercial transportation or general usage equipment will be enhanced and maintained.

RELIABILITY QUESTIONS AND ANSWERS

AC RATED CAPACITORS

What are the limiting factors restricting the use of metallized polycarbonate capacitors for AC applications?

A properly manufactured and screened capacitor can handle considerable RMS and peak currents from −55°C to +125°C without significant case temperature heat rise. The dissipation factor of capacitors to be used in AC applications must be uniformly low to limit the watts loss incurred usually by capacitors with a high (ESR) equivalent series resistance.

We recommend a maximum dissipation factor of 0.15% at 1KHz as the acceptance test limit. All capacitors should be subjected to temperature cycling prior to final measurement of DF to observe if they remain less than 0.15%. This test eliminates problems which may occur in use, after storage, or operation at extreme temperatures, leading to higher DF and operational failure.

CRC catalog page 1117 contains the maximum RMS current and voltage ratings for sinusoidal conditions, continuous duty cycle, at 400Hz and 40KHz. For conditions other than shown, send to our sales office a sketch of the current and voltage waveforms under worst case and normal operating conditions. Include all other information necessary for quotation purposes.

Is polycarbonate better than other dielectrics for AC applications?

If size, weight, cost, or operating temperatures were not important considerations, then other dielectric style capacitors are superior to polycarbonate.

As an example, CRC can supply polystyrene, teflon, or polypropylene AC capacitors with approximately ten times lower loss than the series 12 polycarbonate capacitors.

Polysulfone introduced as a new product on pages 1126-1129, is slightly better than polycarbonate for AC applications below 100°C, and can be used above 125°C (the limit for polycarbonate), to 150°C with proper voltage derating.

CRC considers mylar and paper dielectric styles too lossy for AC applications and therefore does not recommend this type for such requirements. Additional information on AC capacitors appears on other pages of this catalog.

What type of screening test will assure that the polycarbonate capacitors are reliable for AC applications?

Once it has been determined that your application requirements can be met by CRC standard polycarbonate series 12 capacitors, the screening test used by CRC and incorporated into MIL-C-83421/1 will be sufficient to provide the quality assurance needed.

As an example 100% of the capacitors are temperature cycled then are subjected to a square wave voltage at 100Hz at 300% of rated DC voltage for peak to peak amplitude.

During this test the capacitors must handle approximately 35 microsecond wide current pulses for one minute at a rate of 200 per second.

A routine examination of the current and voltage waveforms during square wave hipot of 10 uF, 50VDC type CRH capacitors, shows that with 150 volts peak to peak voltage at 100Hz applied, the peak current is 85 amps. This is equivalent to operation with a half sine wave peak current pulse of 8.5 amps/uF at a 200 PPS rate. SEE WAVEFORMS AT RIGHT.

Following the square wave voltage stress test the capacitors must meet 0.15% max. dissipation factor limits.

As shown on catalog page 5, life testing of CRC metallized polycarbonate capacitors at 400Hz and 4000Hz is performed continuously as retention of qualification to MIL-C-83421/1.

Are the new CRC series 12 AC rated polycarbonate capacitors higher in cost than their earlier type PL and PG capacitors supplied since 1965?

A study of series 12 polycarbonate prices, shows that with few exceptions price reductions (particularly for closer tolerances and larger uF values) are the rule. An examination of the series 12 specifications shows higher guaranteed performance and continuous retention of qualification testing. This in itself represents a substantial price decrease in terms of value adding without increased cost.

Why are CRC low dissipation factor polycarbonate capacitors replacing commonly manufactured capacitors in AC applications?

There is a risk that the dissipation factor of such capacitors will increase with use and result in hot spots at the terminations. Field failures of such capacitors have been reported where the capacitors have exploded and caused fire damage.

It may be possible to use ordinary higher DF capacitors without noticeable problems at 400Hz provided that RMS voltage is sufficiently low such that the RMS current is limited. Heat sinking will also help prevent excess heat rise due to poor quality terminations.

Interestingly enough CRC polycarbonate capacitors have a lower dissipation factor at temperatures from 75°C to 125°C than at 25°C which lowers their effective heat rise at higher temperatures. Where the current source is limited, higher DF capacitors may not heat sufficiently to short, but may gradually suffer from increasing DF to the point where they are effectively open.

What is the maximum current that can be applied to MIL-C-83421/1 capacitors?

The 40KHz current and voltage ratings listed in Table I of the Mil-Spec and also shown on page 1117 of this catalog are based upon continuous operation under sinusoidal conditions. It is essential that any use under conditions exceeding these limits be discussed further with our applications engineers for elimination of failures. Under certain conditions, the capacitors can be used at higher frequencies and in square wave filtering applications. For good reliability it is best to study these special applications on an individual basis. CRC plans to provide data tables showing allowable working conditions during higher frequency sinusoidal, pulsed, and non-sinusoidal conditions.

VOLTAGE/TEMPERATURE SCANNING FOR CAPACITOR FAULTS

AUTOMATIC SURVEILLANCE SYSTEM

Automatic surveillance system for detection of capacitor faults. "High impedance" operation is simulated to prevent undetected "clearing". Combined temperature and voltage ramping during computer scanning induces worst case fault conditions. Each capacitor is measured approximately 800 times in each temperature cycle from −65°C to +125°C and from 0 to 30VDC.

Voltage is slowly ramped at approximately 1 volt per minute to limit current and permit scanning thru the full spectrum of low voltage operation from 0 to 30VDC.

Temperature is slowly ramped at approximately 1°C per minute to detect all thermally induced faults while scanning thru the full spectrum of environmental exposure from −65°C to +125°C.

Computer scanning system continuously records individual capacitor serial number with fault and temperature voltage conditions for failure analysis if required.

Computer scanning system continuously monitors and records conditions at time of fault such as voltage and temperature with data traceable back to capacitor tested.

Each capacitor is batch controlled for controlled PDA limiting of faults for very critical applications.

This exclusive CRC test system provides most reliable and in depth screening assurance for all types of capacitors foil or metallized where combined voltage temperature dynamic stresses conceivably can induce some abnormal mode of behavior.

Special screening operations and procedures can be offered to suit individual customer requirements.

TYPICAL CRC SCREENING

The miniature low voltage metallized capacitors manufactured by CRC have been engineered to prevent breakdowns and only on rare occasion have breakdowns been reported to us.

We now have a system for detecting the most elusive intermittent capacitor behavior. This screening should eliminate capacitors which may act intermittently in the field on rare occasion.

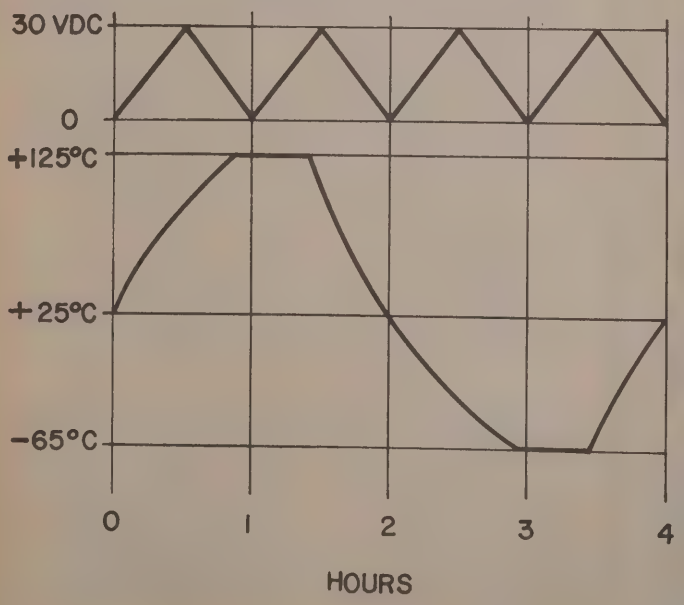
During CRC testing the current is limited to approximately 0.05 microjoules of energy to simulate conditions in which a capacitor could breakdown and fail to clear itself.

They are simultaneously slowly brought up and down in voltage as they are temperature cycled. Using a specially designed (patent applied for) power source and sensitive fault detection system, the capacitors are electronically scanned using a sophisticated Gen. Radio GR 2230.

Each capacitor screened by this system is typically tested over 800 times per cycle for abnormalities such as shorts, opens, intermittents, and low insulation resistance while the capacitor is operating at extremely low to approximately 30VDC levels. At the same time the capacitors are being alternately frozen and heated to induce all possible failure modes if the capacitor is less than perfect.

CRC capacitors 100% screened by this exclusive low energy fault detection system can now provide the highest possible reliability for the most sensitive high impedance applications.

TYPICAL VOLTAGE/ TEMPERATURE RAMP SCREENING CYCLE



This General Radio model 2230 Component Test Systems is used in conjunction with CRC specially designed ramp generators, cycling chambers, and interface equipment for voltage/ temperature capacitor fault-scanning.

HIGH PULSE CURRENT HANDLING METALLIZED CAPACITORS

Foil type capacitors constructed from low loss dielectric plastic films such as Teflon, Polypropylene, or polystyrene are generally most capable of handling high peak currents at extremely fast switching rates.

Metallized capacitors are approximately one third to one half the size of metal foil capacitors and can be used in most AC applications formerly considered the domain of metal foil types.

As an example a 10uF, 30VDC, metallized polycarbonate capacitor type G12A106 was charged at 30VDC and discharged into a 0.02 ohm vacuum switch at a 1 PPS rate for days to determine if it would open up. There was no noticeable effect on ESR or dissipation factor as a result of this test.

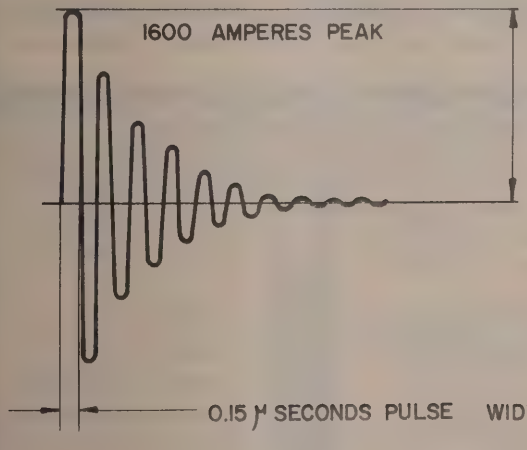
During this test the first ½ sine discharge current pulse was approximately 180 amperes and decayed to zero current after several 100KHz resonant cycles.

We attempted to open this miniature 10uF capacitor by charging it with 100VDC which resulted in a first ½ sine pulse current of 500 amperes peak at a 1 PPS rate for several hours. Despite the voltage overstress applied and the extremely high peak capacitor current developed, we could not degrade the termination quality of the G12A106 capacitor.

We can conclude that CRC miniature metallized polycarbonate capacitors are capable of handling enormous discharge current provided the repetition rate is slow.

A study is now being conducted by CRC to determine the optimum AC operating conditions with maximum energy density under high current pulse conditions for metallized vs. metal foil capacitors.

These tests will determine what repetition rate conditions require a larger foil capacitor instead of a smaller metallized film capacitor for failure-free operation.



IN THIS TEST A 1 uF, 400VDC, METALLIZED POLYCARBONATE CAPACITOR, TYPE K12E105, IN A 0.750" X 1.875" CASE DEVELOPED 1600 AMPERES PULSE CURRENT WHEN DISCHARGED INTO A 0.02 OHM SWITCH LOAD AFTER CHARGE AT 800VDC. REPETITION RATE WAS 1 PPS AND NO DEGRADATION OF ESR OR DISSIPATION FACTOR OR CASE WARM-UP WAS MEASURABLE AFTER SEVERAL HOURS OF OPERATION.

100% INSPECTION PER MIL-C-83421 & MIL-C-39022

The high reliability capacitor screening plans developed by Component Research Co. have been adopted by space and military contractors throughout the world for critical programs. The new general specification MIL-C-83421 incorporates much of the screening features shown below at an attempt to provide a "state of the art" capacitor specification for general industrial and aerospace use.

Our flow plan for manufacturing and inspection shown below covers the steps used to process and screen all of our polycarbonate, teflon, polystyrene and polysulfone film capacitors. The individual specifications shown in the catalog list the actual screening performed for each style. A choice of three quality levels provides different degrees of intensive screening to assure the highest possible quality at lowest cost. Special screening plans are available which include tests such as 100% corona inception inspection, 40KHz AC burn-in at 100°C, high impedance monitoring for intermittent conditions at low voltage during temperature cycling, ESR inspection at 100KHz, dielectric absorption effects with rapid switching rates and varying temperature, and many other sensitive measurement phenomena.

100% PROCESSED AND SCREENED

Steps 1-6 show the 100% processing (up to and including hermetic sealing), of MIL-C-39022/9 and MIL-C-83421/1 qualified polycarbonate and CRC standard capacitors — Polycarbonate, Teflon, Polystyrene and Polysulfone. The quality level selected will be determined by the individual capacitor specification.

THERMAL SHOCK TEST
500 CYCLES

DATA COVERS A12A 30VDC METALLIZED POLYCARBONATE CAPACITORS

Applications such as the space shuttle require capacitors which can withstand many thermal shock cycles without deterioration of terminations.

In 1976 George C. Marshall Space Flight Center contracted Component Research to manufacture and test MIL-C-83421/1 style parts to withstand 500 thermal shock cycles, while maintaining electrical integrity without becoming intermittent.

One hundred and fifty capacitors incorporating design improvements (which have been implemented in all standard parts since completion of the test) were manufactured and subsequently underwent 500 thermal shock cycles.

One hundred and forty nine (149) capacitors survived the tests. Failure analysis of the failed part was due to a poor solder joint, initially detected during acceptance tests as having poor dissipation factor and equivalent series resistance measurements. Operator error precluded the capacitor being eliminated from the test program.

HIGHLIGHTS OF 500 THERMAL SHOCK CYCLE TEST

■ **60 capacitors were subjected to 500 thermal shock cycles** for accelerated test in liquid to liquid, at the rate of fifty (50) cycles per day. The capacitors were immersed into each liquid for sixty (60) seconds and transferred from one bath to another within fifteen (15) seconds. The temperature extremes were −55°C and 125°C.

LIFE TEST
40,000 HOURS

PURPOSE OF 40,000 HOUR LIFE TEST

In 1972 CRC decided to conduct long term life tests on 50VDC metallized polycarbonate capacitors to study the effects of operation at 100°C and rated voltage on capacitance drift, insulation resistance, and dissipation factor.

After five years of test (including approximately 10 months of overstress at 125°C and 280% of rated DC), CRC is pleased to report that our capacitors are highly recommended for long life requirements.

In 1970 thousands of CRC metallized polycarbonate capacitors were used in an underwater cable application requiring a minimum of 20 years operation without failure. There have been no reported failures to date in this critical application or in others, such as long term space probes.

In early 1978 CRC commenced similar life testing of most standard catalog capacitor styles to furnish data which will enable the design of circuits based on expected life for many decades of use.

HIGHLIGHTS OF 40,000 HOUR LIFE TESTING

Test conditions were 50VDC at 100°C for 12,000 hours for 45 capacitors resulting in 0.27% max. capacitance drift, 0.17% max. dissipation factor, and 750,000 megs-uF minimum insulation resistance.

5000 additional hours (in error) were at 125°C and 70VDC which is actually at 280% of rated voltage considering that 50% derating is required from 100°C to 125°C.

As a result one capacitor shorted, capacitance drift was −1.5% worst case. Dissipation factor remained 0.17% max. and insulation resistance was 1,000,000 Megs-uF minimum.

Life testing was continued from 17,000 to 40,000 hours at 50VDC and 100°C with 1.25% max. capacitance drift, 0.19% max. dissipation factor, and 35,000 megs-uF minimum insulation resistance at end of test.

It is obvious that considerably reduced drift and parametric change would have resulted if the 5000 hr. overstress period had not occurred.

CRC ESTABLISHED RELIABILITY CAPACITORS

TYPES A12 & K12 AC RATINGS

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE.

2. CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED.

3. CAPACITORS CAN HANDLE PULSE CURRENTS UP TO 100 TIMES GREATER THAN THE PEAK CURRENTS CALCULATED FROM THE RATED RMS RATING (PROVIDED SLOW REPETITION RATES ARE USED).

IF THERE IS ANY DOUBT A SKETCH OF THE VOLTAGE AND CURRENT WAVE FORMS WITH TIME BASE SHOULD BE SENT TO CRC FOR ANALYSIS.

A10 AC RATINGS

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE.

2. CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED.

3. CAPACITORS CAN HANDLE PULSE CURRENTS UP TO 100 TIMES GREATER THAN THE PEAK CURRENTS CALCULATED FROM THE RATED RMS RATING (PROVIDED SLOW REPETITION RATES ARE USED).

IF THERE IS ANY DOUBT A SKETCH OF THE VOLTAGE AND CURRENT WAVE FORMS WITH TIME BASE SHOULD BE SENT TO CRC FOR ANALYSIS.

P14 AC RATINGS

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE.

2. CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED.

3. CAPACITORS CAN HANDLE PULSE CURRENTS UP TO 100 TIMES GREATER THAN THE PEAK CURRENTS CALCULATED FROM THE RATED RMS RATING (PROVIDED SLOW REPETITION RATES ARE USED).

IF THERE IS ANY DOUBT A SKETCH OF THE VOLTAGE AND CURRENT WAVE FORMS WITH TIME BASE SHOULD BE SENT TO CRC FOR ANALYSIS.

CRC ESTABLISHED RELIABILITY CAPACITORS

TYPE 91 AC RATINGS

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE.

2. CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED.

3. CAPACITORS CAN HANDLE PULSE CURRENTS UP TO 100 TIMES GREATER THAN THE PEAK CURRENTS CALCULATED FROM THE RATED RMS RATING (PROVIDED SLOW REPETITION RATES ARE USED).

IF THERE IS ANY DOUBT, A SKETCH OF THE VOLTAGE AND CURRENT WAVE FORMS WITH TIME BASE SHOULD BE SENT TO CRC FOR ANALYSIS.

TYPES A93-J93-K93 POLYSTYRENE AC RATINGS

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE.

2. CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED.

3. CAPACITORS CAN HANDLE PULSE CURRENTS UP TO 100 TIMES GREATER THAN THE PEAK CURRENTS CALCULATED FROM THE RATED RMS RATING (PROVIDED SLOW REPETITION RATES ARE USED.

CRC ESTABLISHED RELIABILITY CAPACITORS

TYPE A54 FOIL POLYSULFONE

SPECIFICATIONS QUALITY CONFORMANCE

1. THE COMBINED DC AND AC VOLTAGES SHOULD NOT EXCEED THE DC RATINGS, SEE FIGURE. **2.** CAPACITORS MAY BE OPERATED AT HIGHER FREQUENCIES, AT REDUCED RMS VOLTAGE SUCH THAT MAX. AC CURRENT RATINGS ARE NOT EXCEEDED. **3.** TYPE A54 CAPACITORS CAN HANDLE MUCH HIGHER PULSE REPETITION RATES THAN METALLIZED CAPACITORS.

A54 SPECIFICATIONS

OPERATING TEMPERATURE	−65°C to +125°C	At full rated voltage, derate linearly to 50% of rated voltage at 150°C.
DIELECTRIC ABSORPTION	0.1% maximum	At 25°C when measured per MIL-C-83421.
DISSIPATION FACTOR	0.1% maximum	At 25°C when measured per MIL-C-83421.
AC SQUARE WAVE	100Hz, 60 seconds minimum	At 25°C at a peak to peak voltage of 3 times rated DC voltage, terminal to terminal per MIL-C-83421.
DIELECTRIC STRENGTH	200% DC volts	At 25°C from terminal to terminal and terminals to case for 60 seconds minimum.
TEMPERATURE COEFFICIENT	±2% maximum capacitance change	From −55°C to +150°C.
CAPACITANCE STABILITY	±0.25%	When measured at any two corresponding temperature points taken in five successive temperature cycles from −65°C to +125°C.
HERMETIC SEAL	1×10^{-6} atm/cm³/sec.	Maximum leak rate.
INSULATION RESISTANCE	See I.R. Table	Measured from terminal to terminal at rated DC voltage and 5 minutes charge time. Values greater than 1uF, allow an additional minute/uF charge time.

MINIMUM INSULATION RESISTANCE AT RATED DC VOLTAGE

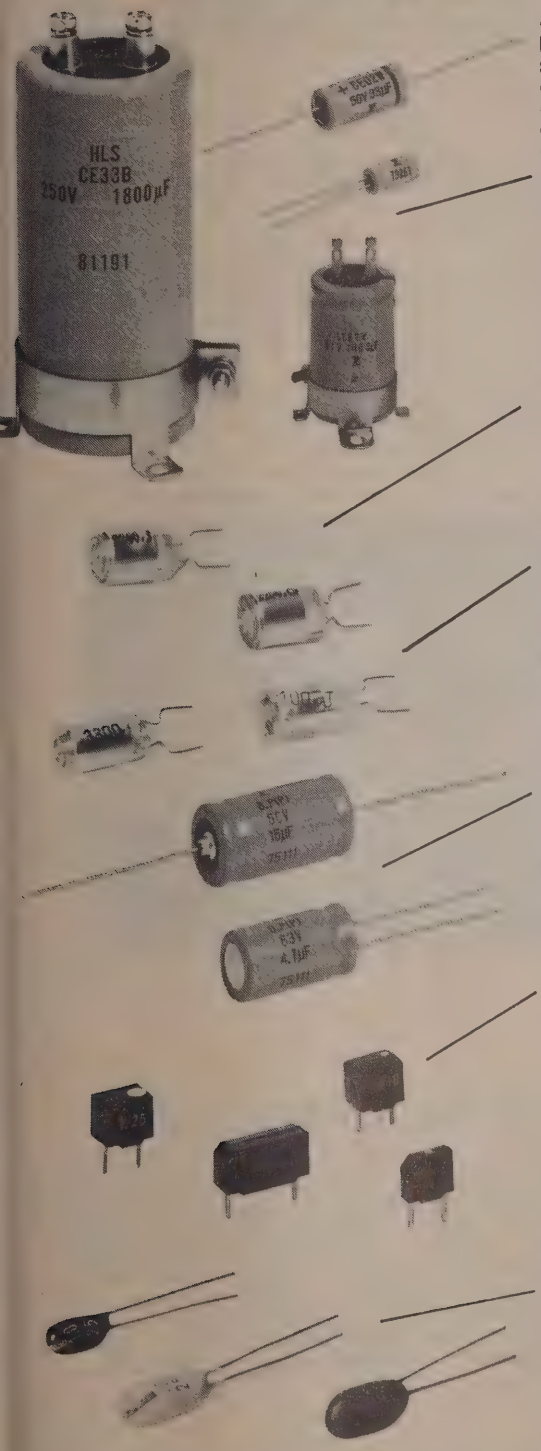
FUJITSU: CAPACITORS



ALUMINUM ELECTROLYTIC CAPACITORS

Large capacitance, high-reliability capacitors designed specifically for televisions, radios, tape recorders, and other audio/visual products, and various applications in transistor circuits. Chlorinated vinyl-covered aluminum electrolytic capacitors with rubber insulating sleeves and choice of single end (radial) leads, axial leads, or solder-plated terminal lugs. Operating temperatures range from −40°C to +85°C for applications up to 100 volts, and from −25°C to +85°C for applications of 160 volts and higher. Manufactured to conform with W characteristics in JIS-C-5141. Prices range down to $0.03, depending on quantity and model.

STYCON 500 SERIES FILM CAPACITORS

Developed to have excellent heat resistance characteristics and still offer the best capacitor performance on the market. Can be safely mounted on PC board even at the flow soldering conditions of 260°C for 5 seconds or 300°C for 3 seconds. Operating temperature range from −10°C to +85°C for applications up to 50 Vdc. Stands only 15mm above PC board and requires only a 5mm spacing. Price range down to 3.5 cents depending on quantity and model.

STYCON 600 SERIES FILM CAPACITORS

Has all the excellent features of the Stycon 500 described above but improved to offer a greater range electrostatic capacity coverage. Specifications are otherwise similar. Temperature range from −25°C to +85°C for applications up to 50 Vdc. Price range down to 3.5 cents, depending on quantity and model.

NON-POLARIZED CAPACITORS FOR ACOUSTIC NETWORKS

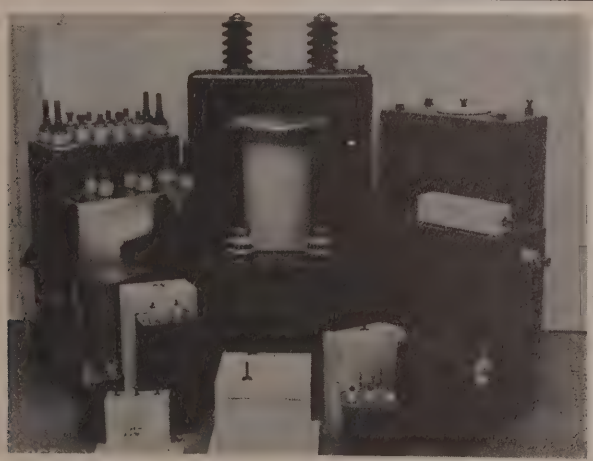
High Energy RF rated ceramic transmitting capacitors are designed primarily for use in applications where high RF currents, high KVA ratings and high working voltages exist. Special capacitor design such as: Water Cooled Ceramic Capacitors, Air Cooled Ceramic Capacitors, Slug Capacitors, RF Transmitting Capacitors, reduces self-inductance to permit higher frequency operation. A humidity resistant silicone coating and long flashover path assures safe, high voltage operation in free air. Units also feature stable temperature-capacitance characteristics and rugged mechanical construction for maximum reliability.

These capacitors are extensively used in transmitters, antennas, induction heaters, X-ray, diathermy and electronic welding equipment.



OIL FILLED CAPACITORS

High Energy encases the oil filled capacitors in heavy gauge steel which is heliarc welded to insure maximum strength. In addition, High Energy also uses a high impact thermoplastic housing eliminating the need for insulators and allowing for considerable versatility in mounting. May be operated in air, oil or dielectric gases including SF_6. The terminals are flush mounted female threaded inserts. High Energy also designs and manufactures many custom oil filled configurations. Consult the factory for information.

vacuum capacitors

ITT Jennings offers the broadest available line of high voltage capacitors for radio frequency applications. Units are available in glass and ceramic envelopes with working voltage ratings of 2 kv to 36 kv, at capacitance values to 5000 pfd, with current ranges to 420 Amps RMS (air-cooled) and 1,000 Amps RMS (water-cooled), depending upon capacity, frequency, and working voltage. The design of ITT Jennings Vacuum and Gas capacitors allows a number of electrical, mechanical and environmental advantages which include:

1) HIGH VOLTAGE—The high dielectric strength allows maximum voltage levels for a given capacitance rating.
2) HIGH CURRENT—Extremely low losses occur because of the dielectric, low loss glass and ceramic envelopes, and heavy copper construction. ITT Jennings capacitors are able to handle large currents at high RF frequencies that would destroy other types of capacitors.
3) COMPACT DESIGN—Units are quite small for their power handling capabilities.
4) HIGH Maximum to Minimum CAPACITY RATIO—Capacity change ratios are available to 140:1, making them desirable for wide tuning ranges.
5) SELF-HEALING—The design construction permits moderate overloads that would damage other materials.
6) HIGH ALTITUDE OPERATION—Vacuum capacitors are free from internal degradation due to extreme environmental conditions.

[1] RF working voltage is the maximum RF voltage that can be applied to the capacitor over the 2-32 MHz frequency range, provided the RF current rating is not exceeded.

[2] RF current rating is dependent upon capacity, frequency and working voltage. Write for complete applications data.

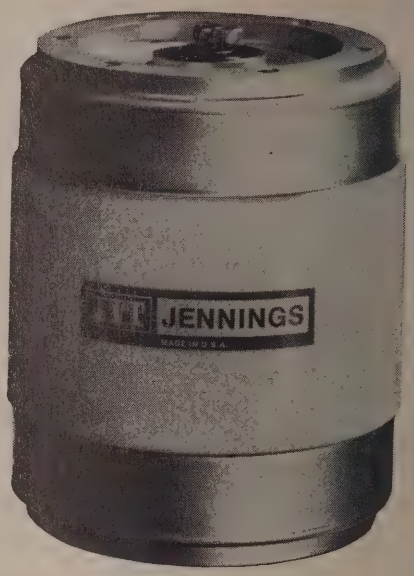
CTV SERIES TRIMMABLE-FIXED† VACUUM CAPACITORS FOR POWER APPLICATIONS — THE FIXED CAPACITOR YOU CAN TRIM

- Adjustment from 5% to 30% of nominal capacitance
- From 18 to 1377 pF in discrete steps
- Peak 60 Hz test voltages to 50 KV
- High current ratings — to 150 A rms
- Compact — 5.5″ long x 4.5″ dia.



These new devices offer designers a new means of achieving the exact capacitance required in high power circuits. Incorporating in one package a trimmer in parallel with a large fixed capacitance, they eliminate the need to use large, fully variable capacitors or the use of multiple fixed capacitors in many applications. They are ideal solutions for filter circuits, antenna phasing and matching networks in high power communications gear and for dielectric heaters and other high power RF equipment.

With ceramic envelope construction, they have fixed, concentric capacitor plates, in the core of which is a set of plates attached to a small sealed bellows which is adjusted by a screw. Because the trimmable section conducts only a small portion of the total current, these units have a very large current rating for their size.

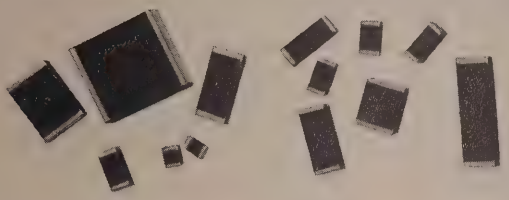
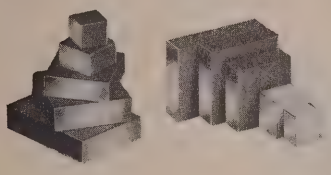
Johanson Dielectrics Ceramic Chip Capacitors



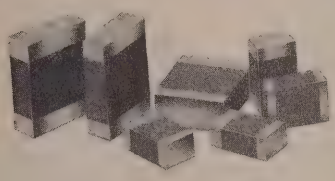
Ultra High Capacitance Chip Capacitors

Fourteen configurations are available in four basic dielectrics: NPO/COG, BX/X7R, Z5U, and Y5V characteristics, to meet MIL-C-55681A and EIA 198B specifications. Capacitors feature high volume efficiency of capacitance, and are ideal for hybrid circuit applications.



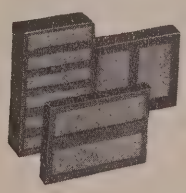
High Voltage Chip Capacitors

Available in either NPO/COG or BX/X7R dielectric, these units are designed to obtain high voltage values to 4000 VDCW. Typical applications include high voltage power supplies and voltage multiplier circuits.



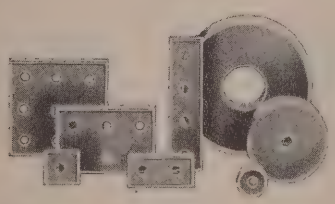
High Q Microwave Chip Capacitors

High Q microwave chip capacitors are available in four basic sizes, displaying excellent performance in the VHF, UHF and microwave ranges. The configuration, insertion loss and resonance-free performance make these chips ideal for microstrip and hybrid MIC applications.



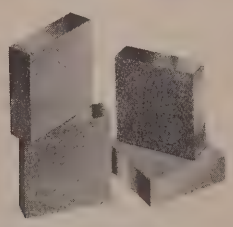
Multiple Capacitor Arrays

Custom designed multiple capacitor elements are ideal for multiple circuit coupling, filtering, bypass and high voltage multiplier circuits. Multiple capacitor arrays are practical replacements for individually bonded chips in hybrid circuits and are available in a variety of dielectric characteristics.



Feed-Thru Capacitors

Designed for use in filter networks and as signal by-pass elements, ceramic feed-thru capacitors are available in circular, square and rectangular (multi-feed-thru) configurations in NPO/COG, BX/X7R, Z5U or Y5V dielectrics.



Ceramic Capacitor Wafers (Single Layer)

Ideally suited for micromodule and miniature hybrid integrated circuits where low profile requirements preclude the use of conventional multilayer chip capacitors. These units are used as by-pass, shifter, blocking and filtering elements, (to 18 GHZ in microwave applications). Custom configurations are also available for high voltage applications to 15 KV.

Unlike some distributors who carry a little of everything, we carry a lot of a few. We have in-depth stock of every MIL and INDUSTRIAL part we carry. So when you need more than one of a kind, you won't have to frantically call dozens of people to round up all the parts you need. You'll get them all at Fairmont.

That's because we maintain a computerized parts inventory system that ensures a continual parts availability to all our customers.

TANTALUM WET SLUG CAPACITORS

CTL TYPE—LOW COST, MINIATURE, HIGH CAPACITANCE, POLAR

LOWER COST—LOW DC LEAKAGE

The Mallory CTL Capacitor is a low-cost miniature polar wet slug tantalum capacitor in a Mallory proprietary low-cost copper-alloy case. The CTL offers MIL-C-3965C Type CL64 and CL65 ratings at lower cost than the comparable silver case Type TLS.

The CTL is specifically designed for high volumetric efficiency with extremely low d.c. leakage. They are ideally suited for energy storage and critical timing circuits.

The CTL has the same reliable end seal construction as the TLS. This new improved seal was introduced to withstand the extended thermocycling of MIL-C-39006B. A total of 17.86 million unit-hours of storage time have been accumulated with this new seal demonstrating the reliability. No defects have been found thus showing a failure rate of less than .006%/1000 hours with 60% confidence.

The construction of the CTL includes a sintered tantalum anode slug supported on shock pads within the proprietary copper-alloy case. The slug, via an extending tantalum lead wire, is butt welded to a nickel positive lead and surrounded by liquid electrolyte. The case is double-sealed by precision grooving and by roll-crimping onto a special elastomer end bushing and o-ring. Both the nickel positive lead and the copper negative lead are tinned for easy soldering. For additional information send for TIB-4-610.

LOWER COST, SUBMINIATURE TUBULAR WET SLUG — POLAR

The CMT Capacitor is a miniature polar wet slug tantalum capacitor in a Mallory-proprietary copper alloy case. The CMT offers significant cost savings over similar miniature capacitors in silver cases such as Mallory MTP and Sprague 146D.

The CMT facilitates the design of high component-density equipment. Its low-profile geometry and high capacitance-voltage product allow considerable savings in printed circuit space. Its excellent high frequency performance and temperature range allow use in a wide variety of circuit applications.

The construction of the CMT includes a sintered tantalum anode positioned on supports within the Malloy-exclusive case. The anode is contacted by liquid electrolyte which is positively sealed in the case by roll crimping on a special elastomer end plug. A solderable nickel lead is welded externally to the tantalum anode riser. An outer insulating sleeve covers the entire case and red epoxy end-fill. The red epoxy covers and strengthens the anode positive lead weld. For additional information send for TIB-4-609.

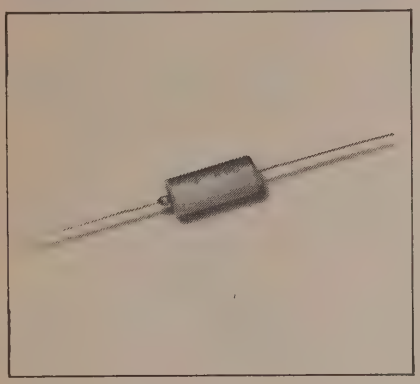
TANTALUM SOLID ELECTROLYTE CAPACITORS

THF TYPE—HIGH RIPPLE PERFORMANCE

FOR SWITCHING REGULATOR POWER SUPPLY APPLICATIONS



ONE REPLACES UP TO FOUR CSR TYPES

The THF solid tantalum capacitor is designed to offer low impedance to ripple current at frequencies above 1 kHz through 100 kHz. Special patented configuration sintered anodes provide lower equivalent series resistance (ESR) at these frequencies in comparison to conventional type solid tantalum capacitors. Lower ESR means lower power losses. Lower power loss characteristics result in savings in space, weight and cost by substituting one THF for as many as four conventional CSR 13 type capacitors to bypass or filter unwanted ripple currents. Ripple Current ratings by part number are shown in the TIB 4-805A. The solid electrolyte combined with the hermetic seal provides an inherently long life time and very stable electrical characteristics over a temperature range of −80°C through 125°C. For additional information send for TIB 4-805A.

ALUMINUM ELECTROLYTIC CAPACITORS

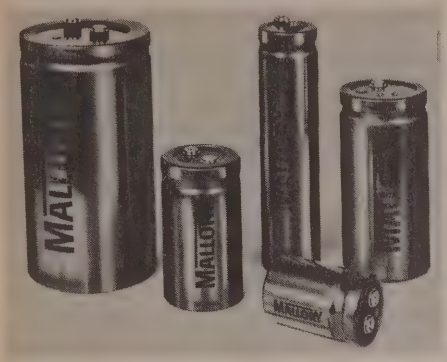
CGR TYPE—LOW ESR, HIGH-RIPPLE COMPUTER GRADE

FOR SWITCHING REGULATOR POWER SUPPLY APPLICATIONS



The CGR is specifically designed as a low ESR, high ripple current power supply filtering capacitor in a rugged aluminum can with a choice of high or low 10-32 screw insert terminal assemblies. The CGR is outstanding in low ESR and DC leakage current plus high ripple current capability over broad temperature and frequency ranges.

With capacitances up to 320,000 μF and ripple capability up to 35.9 amperes at 20 kHz at +85°C the CGR handles extreme application requirements with ease and reliability. The CGR has been quite successfully utilized as an output capacitor in some high frequency switching regulator power supplies. For applications requiring high capacitance/voltage ratings where specifically low ESR and high ripple are not extremely critical Mallory Type CGS is recommended. For applications requiring exceptionally long life Mallory Type CG excels.

See CGR Bulletin 4-313 for 576 standard design ratings, associated part numbers, basic electrical parameters and typical performance curves.

ALUMINUM ELECTROLYTIC CAPACITORS

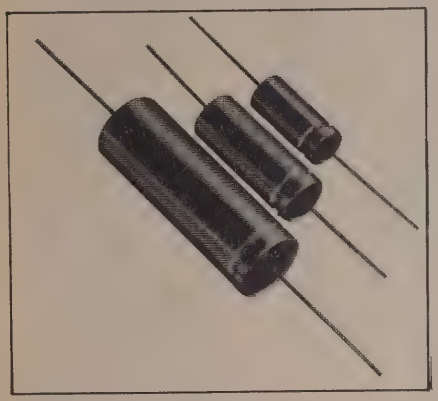
TCX TYPE—EXTENDED TEMPERATURE RANGE TUBULAR COMPUTER GRADE

FOR SWITCHING REGULATOR POWER SUPPLY APPLICATIONS



LOW ESR AND HIGH RIPPLE CAPABILITY

The TCX is designed as a high performance capacitor of Computer Grade quality and reliability. The use of a special electrolyte system provides low DCL, low ESR, and capacitance stability at extreme low and high operating temperatures. The low-loss characteristics in the TCX provides higher ripple current capability than specified in conventional aluminum electrolytic capacitors.

Mechanical construction features a combination molded plastic and rubber ring end seal to insure a tight positive seal of the capacitor. A pressure sensitive safety vent is formed to a controlled thickness in the capacitor can wall to provide protection in case of overload or voltage reversal applied to the capacitor.

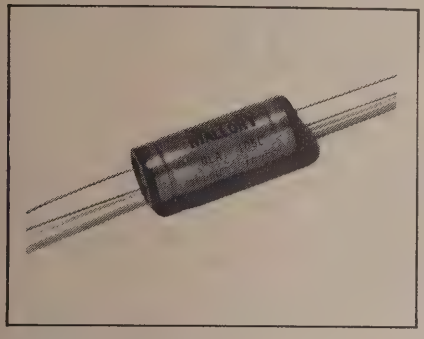
ALUMINUM ELECTROLYTIC CAPACITORS

QLA TYPE—FOUR TERMINAL

FOR SWITCHING REGULATOR POWER SUPPLY APPLICATIONS



LOW INDUCTANCE LOW IMPEDANCE ABOVE 10 kHz

The QLA is an aluminum electrolytic capacitor designed as a four-terminal feed-through device to provide low inductance and low impedance at operating frequencies well above 10 kHz. Conventional two terminal electrolytic capacitors inherently exhibit inductance loss above 10 kHz resulting in instability. The four-terminal QLA offers an inductance limit of 2 nH at 1 MHz making it ideal for use in switching regulators.

The QLA is offered in axial lead form with positive and negative leads at both ends. Either end may be used for the input with the opposite end as the output to filter high frequency ripple. High capacitance values combined with low impedance and inductance losses allows the electrolytic capacitor to be now considered for high frequency applications.

ALUMINUM ELECTROLYTIC CAPACITORS

CGS TYPE — HIGH-PERFORMANCE COMPUTER GRADE

BETTER PERFORMANCE AND RIPPLE CAPACITY

The CGS Capacitor is a high-performance computer grade aluminum electrolytic capacitor in a rugged aluminum can with a choice of mounting and terminal configurations. The CGS excels in initial electrical performance and high ripple capability.

For capacitors having extremely low ESR and DCL, and for applications requiring low temperature, high frequency and high ripple current capabilities Mallory Type CGR is recommended. For applications requiring exceptionally long life, Mallory Type CG excels. But, for work-horse power filtering and energy storage applications, the CGS is the top performer. With capacitances up to 920,000 μF and ripple capability up to 30 amperes rms at 85°C the CGS handles extreme application requirements with ease.

See Mallory CGS bulletin 4-303A for 996 standard design ratings, a complete application guide, typical performance curves, and full performance characteristics.

SFC TYPE—LOW IMPEDANCE AND HIGH RIPPLE CURRENT APPLICATIONS

Design features of the SFC capacitor, including welded plate to terminal connections and massive bus type terminals have made it possible to significantly lower the equivalent series resistance and inductance of the SFC capacitor type as compared to the conventional computer grade capacitor design.

The lower AC loss characteristics of the SFC capacitor are manifested in lower equivalent series resistance, inductance and impedance over a wide frequency range. This improved efficiency makes the SFC an excellent selection for those applications where high ripple current is encountered or where extremely low impedance is required. In some instances, a single SFC capacitor can be used in place of several conventional capacitors.

NON-PCB WITH U.L. RECOGNIZED PROTECTOR

Mallory Bionol Ⓣ capacitors contain a biodegradable dielectric fluid for environmental compatibility. They also incorporate a U.L. recognized internal protective device to minimize the hazard of case rupture in the event of capacitor failure. These capacitors are useful in a variety of applications where continuous operation is required on the normal AC Power source available in home and industry.

They offer good reliability and long life and are designed to meet the intent of EIA Standard RS-454 — characteristic "D." For additional information send for Technical Information Bulletin 4-403.

ELECTRONIC ENGINEERS CATALOGUE

The 1978 edition is out...and the response is in... IMMEDIATE AND OVERWHELMING

ACCEPTANCE

The ELECTRONIC ENGINEERS CATALOGUE is the only comprehensive, trilingual catalogue/source-directory of electronic products available to—and from—Western Europe.

It is divided into three distinct sections: 1. **The Product Index and Directory,** which lists more than 3,000 product headings & cross-references alphabetically in English with their French and German equivalents. 2. **The Manufacturers' Catalogue Section,** which is a compilation of Manufacturers' Catalogues in alphabetical order. 3. **The Manufacturers' Sales Offices and Trade Marks Directory,** which alphabetically includes country, address, telex or TWX numbers of the Manufacturers' main and local sales offices and/or agents.

The ELECTRONIC ENGINEERS CATALOGUE offers U.S. manufacturers the most cost-efficient method of distributing their catalogue data to **25,000** electronic engineers and buyers throughout Western Europe. It represents the carefully conceived application of the time-proven **eem** "cataloging" concept to the elusive European marketplace.

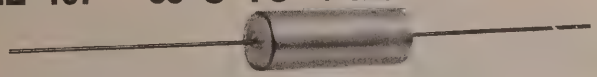
POLYESTER FILM CAPACITORS

POLYESTER FILM CAPACITORS EXTENDED FOIL/FILM WRAP/EPOXY END FILL STYLE 107 −55°C TO +125°C



ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

CAPACITANCE MEASUREMENTS
Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF shall be measured at 60 Hz. The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202, Method 305.

TEMPERATURE CHARACTERISTICS
The maximum change in capacitance from the measured value at +25°C shall be −6% at −55°C, and +15% at +125°C.

DISSIPATION FACTOR
When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.6% for values up to 1.0 μF and shall not exceed 1.0% for greater capacitance values.

INSULATION RESISTANCE
When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 50,000 megohm-microfarads, but need not exceed 100,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

VOLTAGE DERATING
The capacitors may be operated at full rated voltage from −55°C to +85°C, or with linear derating to 50% of rated voltage above +85°C with a maximum temperature of +125°C.

VOLTAGE TEST
When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case (less than .235 diameter)	200% of DC rating
Terminal to case (greater than .235 diameter)	400% of DC rating or 2,000 VDC, whichever is less

Reference: MIL-STD-202, Method 301.

LIFE TESTING
When tested for 1000 hours at 150% of the appropriate rated voltage for the test temperature, the capacitors shall exhibit no more than one failure in twelve pieces tested. Alternatively, an accelerated +125°C test may be performed at the +85°C voltage rating for a period of 250 hours. A failure is defined as:

a) A capacitance change of more than 10% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than ⅓ that specified in Paragraph 4; or
d) A permanent open or short.

VIBRATION
The capacitors will meet or exceed in the vibration requirements of MIL-STD-202, Method 201.

CAPACITANCE MEASUREMENTS
Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz.

Capacitors greater than 1.0 μF shall be measured at 60 Hz.

The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202, Method 305.

Type 188 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE
Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE
Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR
The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE
Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES
−55°C to +125°C.

LIFE TEST
Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING
These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION
Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287. After test, the I.R. will be equal to or greater than ⅓ of the initial requirement.

HUMIDITY TEST
These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than ⅓ of the initial requirement.

METALLIZED POLYESTER CAPACITORS TYPE 189 FILM WRAP / EPOXY END FILL −55°C TO +125°C

Type 189 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE
Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE
Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR
The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE
Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES
−55°C to +125°C.

LIFE TEST
Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING
These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION
Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287.

HUMIDITY TEST
These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than ⅓ of the initial requirement.

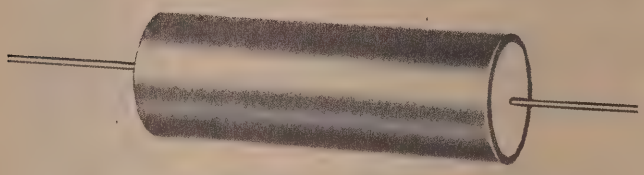
TUBULAR CAPACITORS

HIGH VOLTAGE TUBULAR CAPACITORS DUAL DIELECTRIC/OIL IMPREGNATED PHENOLIC CASED/EPOXY END FILL/TYPE 161



RECOMMENDED APPLICATIONS

Nytronics Type 161 Capacitors are well-suited for use in Oscilloscopes, Electronic Air Cleaners, Power Supplies of industrial devices, and related equipment. The design of these capacitors employs a Paper/Polyester Film Section, oil impregnated, incased in a phenolic tube designed specifically for high voltage application. A unique epoxy endfill process precludes oil seepage which occasionally occurs in similar designs.

OPERATING TEMPERATURE

−55°C to +85°C at full rated voltage.

DISSIPATION FACTOR

Will not exceed 1% at 25°C.

MEASUREMENTS

Capacitance up to 1 microfarad are measured at a frequency of 1000 cycles per second and capacitances over 1 microfarad at 60 cps.

DIELECTRIC STRENGTH TEST

Units will withstand a potential of 150% of rated voltage applied for one minute at 25°C.

STANDARD TOLERANCE

±20%. Other tolerances available on request.

STANDARD MARKING

Nytronics, Part No., Capacitance, Voltage, and Date Code.

INSULATION RESISTANCE

When measured at the applicable test temperature with an electrification time of two minutes at 500 volts shall be equal to or greater than the values listed below:

Test Temperature	25°C	85°C
Megohms X Microfarads	2000	10
except that the insulation resistance in megohms need not exceed	25000	250

MOISTURE RESISTANCE

These capacitors will meet the moisture resistance requirements of EIA Specification RS-164, which requires units to withstand a 95% Relative Humidity at 40°C, except time of exposure may be increased to 500 hours. After exposure and subsequent drying periods, the insulation resistance will not be less than ⅓ of the initial requirement.

ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

1. CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF measured at 60 Hz.
Tolerances of ±20%, ±10%, ±5%, ±2%, ±1% are standard. Tolerances closer than ±1% are available upon request.
Reference: MIL-STD-202, Method 305.

2. TEMPERATURE/CHARACTERISTICS AND STABILITY

When measured over the full operating range, the Temperature Coefficient shall be −120 ppm/°C ±30 ppm/°C.
There shall be less than 0.1% change per year in capacitance when operated between +20°C and +50°C. When cycled from −55°C to +75°C, the capacitance shall not vary more than 0.2% from its initial measurement.

3. DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.1%.

4. INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 200,000 megohm-microfarads, but need not exceed 500,000 megohms. The period of electrification shall not exceed two minutes.
Reference: MIL-STD-202, Method 302.

5. VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C.

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:
Terminal to terminal 200% of DC rating
Terminal to case 200% of DC rating
Reference: MIL-STD-202, Method 301.

7. LIFE TESTING

When tested at 85°C for 250 hours at 140% of the rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:
a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

UNITED PRICING REPORTS

the single source that speeds up invoicing, pricing, quoting, purchasing and estimating

Electronic component prices change so fast, you'd need a team of people just to keep up.

United Pricing Reports is the better way. When you subscribe to Pricing Reports you receive 1500 pricing sheets (3000 pages) of the latest prices, as of the date we ship them to you.

This gives you, in a single source, up-to-the minute selling prices on more than 500,000 electronic components.

United Pricing Reports gives you accurate resale prices at the exact moment you need them. Not hours or days later. So it helps you eliminate frantic phone calls, letter writing and catalog scanning to check on prices when you write an invoice or type a purchase order.

Twice weekly price updates.

One week after you receive your Pricing Reports source book (1500 pricing sheets) you begin receiving twice weekly price updates. You simply take these new price pages and replace the now obsolete pages with them.

The whole process is simple. All information is organized alphabetically by manufacturer. And each manufacturer's price schedule is listed by part number in numerical/alphabetical sequence.

One more thing. When we promise twice weekly updates, we deliver. 52 weeks a year, consistently. Not monthly or every other month. We have a tradition of delivery on our promises, and we're certainly not going to stop now.

This Military Part Numbering System is not correct in accordance with the current specifications. The correct current designation for a CSR part number is the MIL Specification Number, followed by the Specification (slash) Sheet Number and Dash Number (i.e. — MIL-C-39003/01-2270). However, the part number breakdown shown above is still widely used and is shown for reference.

T110 SERIES — POLAR TYPE

KEMET standard MIL case hermetic sealed T110 Series are the leading solid tantalum capacitors in use today. They are compact, ruggedly built, designed for miniaturized circuitry, and are especially suited for coupling, by-pass, filtering, and R-C timing circuits. They exhibit excellent stability, extremely low DC leakage current, dissipation factor, and impedance over a wide temperature and frequency range.

Available in standard EIA capacitance values from .0047-330 μF in ±20%, ±10%, and ±5% tolerances and working voltages from 6-125 VDC.

Included in the following T110 Series table is a complete listing of MIL-C-39003 CSR13 capacitors which KEMET is approved to manufacture to the S (0.001%/K hrs.) failure rate level. For additional info refer to KEMET Cat. F-1851H.

T111 SERIES — NON-POLAR & T213 (CSR91)

Primarily designed for use in tuned low frequency circuits, phasing low voltage AC motors, servo systems and other applications where reversal of polarity is a primary consideration. Compact unit consists of two polar T110 Series hermetically sealed, tantalum capacitors electrically and mechanically connected back-to-back and supported by an outer corrosion-resistant metal sleeve. They exhibit comparable electrical and performance characteristics of T110 Series. Available in capacitance values ranging from .0023 to 160 μF in ±20%, ±10%, and ±5% tolerances in working voltages from 6 to 125 VDC at +85°C. Also available in extended range version (T141 Series) and as MIL-C-39003 CSR91 Capacitors (T213 Series). For further information refer to KEMET T111 Series Catalog.

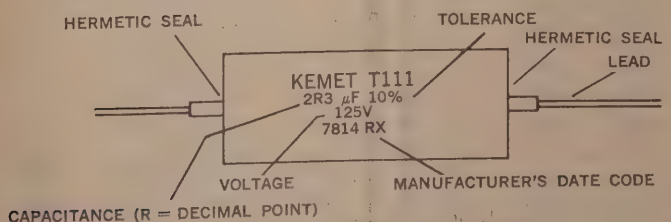
CAPACITOR MARKING

Unless otherwise specified by special order, standard marking of T111 Series capacitors is shown in Figure 3.



Standard Marking for Non-Polar Solid Tantalum Capacitors

KEMET SOLID TANTALUM CAPACITORS

UNION CARBIDE

T120 & T222 (CSR09) POLAR MINIATURE TANTALUMS

KEMET ultra-miniature T120 Series solid tantalum capacitors are designed especially for cordwood construction modules. They offer circuit designers the highest density solid tantalum capacitors on the market. For example, the A case is two-thirds the size of the standard A case in T110 Series capacitors.

The T120 Series capacitors employ a unique glass-to-metal compression end seal which has no protruding eyelet. This flush end seal construction makes T120 Series capacitors ideally suited for all cordwood circuits, point-to-point wiring and other high density packaging applications. The capacitors consist of a dry porous tantalum pellet hermetically sealed in a solder coated metal case with solder coated alloy 52 and solder coated nickel leads.

The T120 Series capacitors provide highly reliable performance. They meet the environmental characteristics of the established reliability specification MIL-C-39003 as well as the less demanding requirements of MIL-C-26655B.

T120 Series capacitors are available in capacitance values ranging from .0047 to 22 microfarads in ±20, ±10, and ±5% tolerances; and in DC working voltage from 6 to 125. They are constructed for continuous duty at nameplate voltage over a temperature range from −55°C to +85°C. Operation at +125°C is equally as reliable when nameplate voltage is derated one-third.

SOLID TANTALUM CAPACITORS

UNION CARBIDE

T140 SERIES — SUPER CAPACITANCE & T242 (CSR23), T252 (CSR33) CAPACITORS

Available to 1000 μF 6 VDC, 560 μF 10 VDC, 330 μF 15 VDC, these high capacitance to volume ratio, hermetically sealed solid tantalum capacitors are offered in standard MIL style A, B, C, and D cases. Available in a wide range of capacitances and working voltages, they effectively extend the CV range of the popular KEMET military type T110 Series. They meet or exceed the environmental and mechanical requirements of MIL-C-39003. Designed to operate from −55°C to +125°C, they exhibit exceptionally low DC leakage, dissipation factor and impedance characteristics. They are ideal for coupling, by-pass, filtering and timing circuits, and are excellent substitutes for wet tantalums in low voltage applications. They are also available in styles CSR23 (T242 Series) and CSR33 (T252 Series) per MIL-C-39003, and in a high reliability version per specification GR500/A (T240 Series).

CAPACITOR MARKINGS

KEMET T210, T211, T220, T240 GR500 GRADED RELIABILITY SOLID TANTALUM CAPACITORS

For the ultimate in high reliability design in KEMET's GR500 Capacitors with failure rates as low as .001% per 1,000 hours. These Capacitors are manufactured to KEMET's Specification GR500 and meet or exceed all requirements of MIL-C-39003.

GR500 Capacitors offer a demonstrated failure rate calculated from the most sophisticated and accurate reliability measurement method in the capacitor industry. Each production lot of these capacitors is subjected to accelerated life testing on a 100% basis under low impedance circuit conditions. The subsequent accumulated data is applied to Weibull Analysis (demonstrated below) for establishing the exact failure rate. These test results including the Weibull plot, and a summary of failure rate calculations are supplied with each shipment of capacitors.

In addition, all KEMET GR500 Capacitors are temperature cycled 5 times at −65°C to +125°C and receive seal test, leakage current, capacitance, dissipation factor, X-Ray, visual, and mechanical inspection on a 100% basis.

For a copy of Graded Reliability Specification GR500 and additional information on these capacitors, contact your KEMET Sales Representative.

KEMET SOLID TANTALUM CAPACITORS

UNION CARBIDE

T322 SERIES — EXTENDED RANGE — PRECISION MOLDED

Extended range molded solid tantalum capacitors designed specifically for high speed automatic insertion applications. These capacitors offer an extremely high capacitance to volume ratio while still maintaining excellent performance characteristics. Supplied in four axial-lead tubular case sizes, these capacitors are ideally suited for use in printed wiring boards and all applications requiring a high degree of packaging density. The low impedance at high frequencies offered by this capacitor is especially suitable for decoupling required by high speed computers. T322 Series dimensions and tight lead wire-to-body concentricity permit installation by same automatic insertion equipment used for diodes and resistors. Available in working voltages of 2 (68 μF maximum), 4, 6, 10, 15, 20, 25, 35, and 50 (4.7 μF maximum) volts. Operating temperature range −55°C to +85°C with no voltage derating required. For additional information refer to KEMET T322 Product Catalog Form Number F-2875.

T330 SERIES — PRECISION MOLDED — RADIAL LEAD

Kemet *T330 Series, polar-type, radial lead rectangular Precision Molded Tantalum (PMT) capacitors are primarily designed for applications that demand full use of the premium space available in printed circuitry and high density packaging. Compact, space saving T330 Series capacitors provide superior packing factor and space utilization compared with tubular units of the same microcoulomb (CV) rating.

T330 Series capacitors employ a rectangular sintered, dry tantalum anode transfer molded in precision dies with a high impact resistance plastic having excellent electrical, physical, and moisture resistant properties. The A Case is printed with polarity marking whereas B, C, and D Cases have the polarity symbol permanently molded on top of the plastic case. The radius on the two vertical edges at the positive end of B, C, and D Cases can also be used as a sensing dimension for automatic insertion processes. The location of the standoffs may serve a similar sensing function for the A Case. These standoffs, located in the base of all case sizes, provide vents for air circulation and also allow easy removal of flux residues from leadwire and circuit board solder joints.

T330 Series capacitors are highly reliable and exhibit performance characteristics typical of military test standards. They are available in capacitance values ranging from 0.1 to 220 microfarads in ±20, ±10, and ±5% tolerance levels, and in working voltages from 6 to 50 volts. At 85°C the capacitors will operate continuously at full rated voltage. They are rated to 125°C when operated at 2/3 of nameplate voltage. In addition, they feature exceptionally low DC leakage and Dissipation Factor characteristics. These capacitors meet or exceed the environmental requirements (except hermeticity tests) of MIL-C-39003.

They are ideal for by-pass, coupling, and timing applications in computers, military ordinance, industrial, entertainment, and consumer electronic equipment.

UNION CARBIDE

MICRON SERIES

The KEMET Micron Series is a complete line of microminiature solid tantalum capacitors designed to provide maximum electrical performance and capacitance-to-volume ratio for micro-miniaturized, high density, and integrated circuits. The capacitors consist of ultra-small anode assemblies encapsulated in plastic. The CV range is .0022-220 μF, 2-50 volts. Capacitance values are identified by color codes. For additional information, including non-polar styles, refer to KEMET Micron Series Product Catalog (Form F-2710).

KEMET SOLID TANTALUM CAPACITORS

UNION CARBIDE

T411 & T421 SERIES — TANTALUM CHIP CAPACITORS

KEMET Tantalum Chip Capacitors present, at an economical price, maximum volumetric efficiency and high temperature capability. They are manufactured using a Union Carbide developed copper coating process that permits assembly temperatures up to 300°C for a short duration and continuous operating temperatures to 175°C when derated linearly to 25% of the 85°C voltage rating. They are specially designed for use in hybrid circuit and PC board applications using solder reflow bonding techniques. The anode connection consists of a solder coated nickel tab. Cathode connection is made to the solder coating surrounding the body of the chip. Standard capacitance values are from 0.1 to 100 μF with unlisted values available on special order. Voltage range is 4 to 50 VDC. For information on chips that are suitable for other bonding techniques (including epoxy), contact your KEMET representative.

KEMET CERAMIC HIGH RELIABILITY CAPACITORS

UNION CARBIDE

GR900 SERIES

INTRODUCTION

Using many of the same disciplines which have made Kemet the leader in the Graded High Reliability Tantalum capacitor field, a separate High Reliability Ceramic capacitor product line has been established. The GR900 molded axial, radial, and chip capacitors are made on this production line. From receipt of raw materials to final shipment, special raw materials, personnel, facilities, and test methods are used. These components are intended to meet the most critical requirements of demanding applications.

SCREENING TESTS

Although the GR900 Series encompasses a broad spectrum of voltages, capacitance values and case sizes, it is imperative that singular batch identity be maintained. Each batch receives 100% non-destructive testing in the order following:

1. **Thermal Shock** — Materials used in the construction of monolithic ceramic capacitors possess various thermal coefficients of expansion. To assure maximum uniformity, each part is temperature cycled 5 times between −55°C and +125°C. Capacitors failing to withstand this environmental stress are rejected.
2. **Voltage Conditioning** — One of the most strenuous environments for any capacitor is the high temperature/high voltage test. All units are subjected to a minimum of 100 hours at twice rated voltage at 125°C. This screening process is made additionally strenuous by the use of a low impedance (less than 3 ohms) voltage source.
3. **Electrical Test** — The following 100% electrical tests are performed.
   1. Dielectric strength at twice rated voltage and 25°C.
   2. Insulation resistance at 25°C.
   3. Insulation resistance at 125°C.
   4. Storage at 150°C for 2 hours minimum without voltage applied followed by a 24 hour stabilization period (temperature characteristic X only).
   5. Capacitance and dissipation factor at 25°C.
   6. Visual and mechanical examination.
   7. Radiographic examination.

SAMPLE TESTS

In addition to these 100% tests, all production batches are subjected to a sample DPA and must meet strict internal void and delamination criteria. Batches failing to meet these criteria may be ultrasonic scanned for removal of marginal product (see general specification GR900 for details).

INTERNAL EXAMINATION

The internal quality of the sectioned capacitors will be examined under 30X or greater magnification. Both sub-samples will be examined for cracks in the ceramic, voids in the dielectric, delaminations, end metalization quality, electrode anomalies, and other pertinent features, including dielectric thickness and ceramic margin thicknesses.

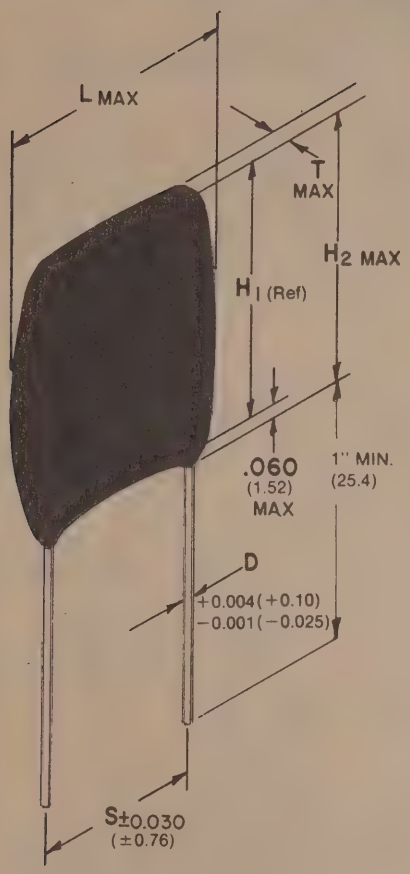
BLUE MAX

DIPPED CASES WITH RADIAL LEADS



The Kemet "Blue Max" product line provides maximum range, conformally-coated capacitors in three dielectrics — COG Ultra-Stable; X7R Stable and Z5U General Purpose. The six case sizes include over 300 CV values in a capacitance range of 1.0pF to 6.8μF in 50, 100, and 200 volts. Their reliable performance is built-in through automated manufacture and precision process control techniques that assure uniform dielectric thickness, excellent electrode integrity, and electrode-to-termination continuity. Internal construction consists of the same superior monolithic body used in Kemet's molded capacitors. Encapsulation consists of a multi-layer moisture and shock resistant plastic coating that meets the flame test requirements of Underwriter's Laboratory Standard 492.

Additional CV values, sizes, and lead configurations are available on special order.

KEMET CERAMIC CHIP CAPACITORS

UNION CARBIDE

CHIP CAPACITORS FOR HYBRID CIRCUITS

Each standard chip features a unique barrier layer of copper in the end metallization that prevents silver leaching or scavenging and subsequent open-circuits during assembly. The "Solder Guard" chips will withstand solder reflow temperatures with little or no degradation of electrical continuity and performance. Other terminations available on special order include silver-palladium, gold, and gold-palladium.

Kemet chips are available in NPO, BX, and Z5U temperature characteristics in 50, 100, and 200 volt ratings. Military grade chips are screened per Group A of MIL-C-55681; in addition to the limited MIL-C-55681, all Kemet chips may be screened to Group A testing of that specification.

FLAT KAP FILM CAPACITORS

Flat Kaps are small ultra stable film capacitors ideally suited for filters, A/D converters, integrators, multivibrator timing capacitors, and other applications where capacitance stability is essential. This stability is obtained by locking the capacitor body in place with a solid impregnant. Outstanding electrical characteristics and volumetric efficiencies, up to 20 times greater than mica, glass, and porcelain are derived from the unique vacuum deposited dielectric, parylene.

Available in three different temperature coefficient of capacitance characteristics: −200, ±30, 0 ±50, and 0 ±100 PPM /°C over the operating range −55°C to +125°C. Capacitors are tested in accordance with MIL-C-55514 and are stocked in all standard values down to ±1% tolerance. Tighter tolerances and non-standard values are available from .001μF to 1μF on special order. For additional information refer to Kemet Flat Kap Product Catalog.

FILM CAPACITORS
METALLIZED POLYCARBONATE FILM CAPACITORS
(MIL-C-83421/01 AND MIL-C-39022/9)

Kemet Metallized Polycarbonate Film Capacitors are designed for circuits requiring stable performance characteristics over a wide temperature range, small size, and operational reliability. They meet the same excellent quality standards associated with all other Union Carbide products. Electrical features include high insulation resistance, low dielectric absorption, low dissipation factor, and full voltage rating to 100°C. In addition, they are AC rated and have the self-healing properties that are inherent in a metallized dielectric. Typical applications include filtering, by-pass, timing, SCR commutating, and 400 cycle AC power circuits. Construction consists of high-purity metallized polycarbonate film with sprayed metal end terminations hermetically sealed in ultra-small solder-coated tubular metal cases. The capacitance range is .001 to 22μF with a DC voltage rating range of 30 to 400 volts. The 400 Hz AC voltage ratings range is 22 to 240 VRMS. The appropriate series are capable of meeting MIL-C-83421 CRH and MIL-C-39022 CHR requirements (see table below). For additional information refer to the Kemet Film Catalog Form F-2871.

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 100,000 megohms-microfarads, but need not exceed 100,000 megohms.

DISSIPATION FACTOR

Shall not exceed 0.75% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.50% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 80°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287,, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

FEATURES

Wrap and fill construction.

Tubular or oval configuration for optimum space savings.

Extended foil design.

Quality control procedures per Mil-Q-9858.

Will meet or exceed Mil-C-27287.

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

METALIZED POLYCARBONATE CAPACITORS

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE
200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE
−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE
At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 50,000 megohms-microfarads, but need not exceed 50,000 megohms.

DISSIPATION FACTOR
Shall not exceed 0.3% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE
Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST
Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)
Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE
Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103B, Condition B.

LEAD PULL AND BEND TEST
Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90 ° in the opposite direction with no evidence of breakage.
